## ATV 31H

Installation manual
Programming manual

Variable speed drives<br>for asynchronous motors

V1.7

$\qquad$

Wiring

## NOTE: Please also refer to the Programming Manual.

When the drive is powered up, the power components and some of the control components are connected to the line supply. It is extremely dangerous to touch them. The drive cover must be kept closed.

In general, the drive power supply must be disconnected before any operation on either the electrical or mechanical parts of the installation or machine.
After the ATV has been switched off and the display has disappeared completely, wait for 10 minutes before working on the equipment. This is the time required for the capacitors to discharge.
The motor can be stopped during operation by inhibiting start commands or the speed reference while the drive remains powered up. If personnel safety requires prevention of sudden restarts, this electronic locking system is not sufficient: fit a cut-off on the power circuit..

The drive is fitted with safety devices which, in the event of a fault, can shut down the drive and consequently the motor. The motor itself may be stopped by a mechanical blockage. Finally, voltage variations, especially line supply failures, can also cause shutdowns.
If the cause of the shutdown disappears, there is a risk of restarting which may endanger certain machines or installations, especially those which must conform to safety regulations.

In this case the user must take precautions against the possibility of restarts, in particular by using a low speed detector to cut off power to the drive if the motor performs an unprogrammed shutdown.

The drive must be installed and set up in accordance with both international and national standards. Bringing the device into conformity is the responsibility of the systems integrator who must observe the EMC directive among others within the European Union.
The specifications contained in this document must be applied in order to comply with the essential requirements of the EMC directive.

The ATV 31 must be considered as a component: it is neither a machine nor a device ready for use in accordance with European directives (machinery directive and electromagnetic compatibility directive). It is the responsibility of the end user to ensure that the machine meets these standards.

The drive must not be used as a safety device for machines posing a potential risk of material damage or personal injury (lifting equipment, for example). In such applications, overspeed checks and checks to ensure that the trajectory remains under constant control must be made by separate devices which are independent of the drive.

The products and equipment described in this document may be changed or modified at any time, either from a technical point of view or in the way they are operated. Their description can in no way be considered contractual.

## Single phase supply voltage: 200... 240 V 50/60 Hz

3-phase motor 200... 240 V

(1)These power ratings and currents are for a maximum ambient temperature of $50^{\circ} \mathrm{C}$ and a switching frequency of 4 kHz in continuous operation. The switching frequency is adjustable from 2 to 16 kHz .
Above 4 kHz , the drive will reduce the switching frequency in the event of excessive temperature rise. The temperature rise is controlled by a PTC probe in the power module. Nonetheless, the nominal drive current should be derated if operation above 4 kHz needs to be continuous.
Derating curves are shown on page $\underline{6}$ as a function of switching frequency, ambient temperature and mounting conditions.
(2)Current on a line supply with the "Max. prospective line Isc" indicated.
(3)Peak current on power-up, for the max. voltage ( $240 \mathrm{~V}+10 \%$ ).
(4)For 60 seconds.
(5)Reference for a drive with built-in terminal but no control unit. For a drive with control potentiometer and RUN/STOP buttons, add an A at the end of the reference, e.g.: ATV31HO18M2A.
(6)4.8 A at $200 \mathrm{~V} / 4.6 \mathrm{~A}$ at $208 \mathrm{~V} / 4.2 \mathrm{~A}$ at 230 V and 240 V.

3-phase supply voltage: 380 ... $500 \mathrm{~V} \mathrm{50/60} \mathrm{~Hz}$

(1)For drives in the A range, add 8 mm for the protruding potentiometer button.

## Mounting and temperature conditions

Install the unit vertically, at $110^{\circ}$.
Do not place it close to heating elements.
Leave sufficient free space to ensure that the air required for cooling purposes can circulate from the bottom to the top of the unit.

Free space in front of unit: 10 mm minimum.

When IP20 protection is adequate, we recommend that the protective cover on the top of the drive be removed, as shown below.

## Removing the protective cover

## 3 types of mounting are possible:

Type A mounting:

Type B mounting:

Drives mounted side-by-side, protective cover removed (the degree of protection becomes IP20)

Type C
Free space $\geqslant 50 \mathrm{~mm}$ on each side, protective cover removed (the degree of protection becomes IP20) mounting:

## Mounting

Derating curves for the drive current In as a function of the temperature, switching frequency and type of mounting.

For intermediate temperatures (e.g. $55^{\circ} \mathrm{C}$ ), interpolate between 2 curves.
If you are installing the drives in enclosures, make provision for a flow of air at least equal to the value given in the table below for each drive.
$\left.\begin{array}{|l|l|}\hline \text { ATV31 } & \text { Flow rate in } \mathrm{m}^{3} / \mathrm{hour} \\ \hline \text { HO18M2, HO37M2, HO55M2, } \\ \text { HO18M3X, HO37M3X, H055M3X, } \\ \text { HO37N4, HO55N4, H075N4, HU1 1N4 } \\ \text { HO75S6X, HU15S6X }\end{array}\right)$

## Mounting

## Electromagnetic compatibility

## EMC mounting plate: Supplied with the drive

Fix the EMC equipotentiality mounting plate to the holes in the ATV 31 heatsink using the 2 screws supplied, as shown in the drawings below.

Size 1-4

Size 5-6

Screws supplied:
$4 \times$ M4 screws for fixing the EMC clamps (clamps not supplied)

Size 8

$1 \times$ M5 screw for ground

## Wiring diagram for factory settings

ATV3 1 eeeeM3X/N4/S6X

Using the analog output as a logic output

(1) Line choke, if used (single phase or 3-phase)
(2) Fault relay contacts, for remote indication of the drive status.

Note: Fit interference suppressors to all inductive circuits near the drive or coupled to the same circuit (relays, contactors, solenoid valves, etc).

Choice of associated components:
Please refer to the catalogue.

## Logic input switch

This switch assigns the logic input common link to $\mathrm{OV}, 24 \mathrm{~V}$ or "floating":

## Examples of recommended circuit diagrams

## Using volt－free contacts

－Switch in＂Source＂position （ATV31 factory setting for types other than ATV31ゃeゃ॰A）

－Switch in＂SINK＂position （factory setting for ATV31•eッeA）

In this instance，the common must never be connected to earth or earth ground，as this presents a risk of unintended equipment operation on the first insulation fault．

## Using PLC transistor outputs

－Switch in CLI position
－Switch in CLI position

## Wiring recommendations

## Power

The drive must be earthed to conform with the regulations concerning high leakage currents（over 3.5 mA ）．
When upstream protection by means of a＂residual current device＂is required by the installation standards，a type A device should be used for single－phase drives and type B for 3－phase drives．Choose a suitable model incorporating：
－HF current filtering
－A time delay which prevents tripping caused by the load from stray capacitance on power－up．The time delay is not possible for 30 mA devices．In this case，choose devices with immunity against accidental tripping，for example RCDs with reinforced immunity from the s．i range（Merlin Gerin brand）．
If the installation includes several drives，provide one＂residual current device＂per drive．
Keep the power cables separate from circuits in the installation with low－level signals（detectors，PLCs，measuring apparatus，video， telephone）．

If you are using cables＞ 50 m between the drive and the motor，add output filters（please refer to the catalogue）．

## Control

Keep the control circuits away from the power cables．For control and speed reference circuits，we recommend using shielded twisted cables with a pitch of between 25 and 50 mm ，connecting the shielding to ground at each end．

## Operation on an IT system

IT system: Isolated or impedance earthed neutral.
Use a permanent insulation monitor compatible with non-linear loads (a Merlin Gerin type XM200, for example).
A
ATV 31 eeeM2 and N4 drives feature built-in RFI filters. These filters can be isolated from ground for operation on an IT system as follows:
ATV31HO18M2 to U22M2 and ATV31H037N4 to U4ON4:
Pull out the jumper on the left of the ground terminal as illustrated below.

## ATV31HU55N4 to D15N4:

Move the cable tag on the top left of the power terminals as illustrated below (example ATV31HU55N4):

IT system
(filter disconnected)

Normal
(filter connected) (factory setting)

## Electromagnetic compatibility

## Principle

- Grounds between the drive, motor and cable shielding must have "high frequency" equipotentiality.
- Use shielded cables with shielding connected to ground throughout $360^{\circ}$ at both ends for the motor cable 6, braking resistor (if used) 8, and control-signalling cables 7. Metal ducting or conduit can be used for part of the shielding length provided that there is no break in continuity.
- Ensure maximum separation between the power supply cable (line supply) and the motor cable.

## Installation diagram (examples)

Sizes 1 to 7

Size 8

Size 9

|  | Size 1 | Size 2 | Size 3 | Size 4 | Size 5 | Size 6 | Size 7 | Size 8 | Size 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{array}{\|l} \hline \text { ATV3 } \\ 1 \end{array}$ | $\begin{aligned} & \text { HO18M3X, } \\ & \text { HO37M3X } \end{aligned}$ | $\begin{aligned} & \text { H055M3X, } \\ & \text { H075M3X } \end{aligned}$ | $\begin{aligned} & \text { HO18M2, } \\ & \text { HO37M2 } \end{aligned}$ | $\begin{aligned} & \mathrm{HO} 5 \mathrm{M} 2, \\ & \mathrm{H} 75 \mathrm{MD} \end{aligned}$ | HU11M3X, HU15M3X | HU11M2, HU15M2 HU22M3X <br> H037N4, HO55N4, H075N4, HU1 1N4, <br> HU15N4 <br> H075S6X, HU15S6X | HU22M2 <br> HU3OM3X, HU4OM3X HU22N4, HU3ON4, HU4ON4 HU22S6X, HU4OS6X | HU55M3X, HU75M3X HU55N4, HU75N4 HU55S6X, HU75S6X | HD11M3X, HD15M3X HD1 1N4, HD15N4 HD11S6X, HD15S6X |

1 Sheet steel grounded plate supplied with the drive, to be fitted as indicated on the diagram.

## 2 ATV 31

3 Non-shielded power supply wires or cable
4 Non-shielded wires for relay contacts
5 Fix and ground the shielding of cables 6, 7 and 8 as close as possible to the drive:

- Strip the shielding.
- Use stainless steel cable clamps of an appropriate size on the parts from which the shielding has been stripped, to attach them to the plate 1.
The shielding must be clamped tightly enough to the metal plate to ensure correct contact.
6 Shielded cable for motor connection with shielding connected to ground at both ends.
The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.
For 0.18 to 1.5 kW drives, if the switching frequency is higher than 12 kHz , use cables with low linear capacitance: max. 130 pF (picoFarads) per metre.

7 Shielded cable for connecting the control/signalling wiring.
For applications requiring several conductors, use cables with a small cross-section ( $0.5 \mathrm{~mm}^{2}$ ).
The shielding must be connected to ground at both ends. The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.

8 Shielded cable for connecting braking resistor (if fitted).
The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.

## Note:

- If using an additional input filter, it should be mounted under the drive and connected directly to the line supply via an unshielded cable. Link 3 on the drive is then via the filter output cable.
- The HF equipotential ground connection between the drive, motor and cable shielding does not remove the need to connect the PE protective conductors (green-yellow) to the appropriate terminals on each unit.

A

NOTE: Please also refer to the "Installation Guide".

When the drive is powered up, the power components and some of the control components are connected to the line supply. It is extremely dangerous to touch them. The drive cover must be kept closed.

In general, the drive power supply must be disconnected before any operation on either the electrical or mechanical parts of the installation or machine.
After the ATV has been switched off and the display has disappeared completely, wait for 10 minutes before working on the equipment. This is the time required for the capacitors to discharge.
The motor can be stopped during operation by inhibiting start commands or the speed reference while the drive remains powered up. If personnel safety requires prevention of sudden restarts, this electronic locking system is not sufficient: fit a cut-off on the power circuit.

The drive is fitted with safety devices which, in the event of a fault, can shut down the drive and consequently the motor. The motor itself may be stopped by a mechanical blockage. Finally, voltage variations, especially line supply failures, can also cause shutdowns.
If the cause of the shutdown disappears, there is a risk of restarting which may endanger certain machines or installations, especially those which must conform to safety regulations.

In this case the user must take precautions against the possibility of restarts, in particular by using a low speed detector to cut off power to the drive if the motor performs an unprogrammed shutdown.

The drive must be installed and set up in accordance with both international and national standards. Bringing the device into conformity is the responsibility of the systems integrator who must observe the EMC directive among others within the European Union.
The specifications contained in this document must be applied in order to comply with the essential requirements of the EMC directive.

The ATV 31 must be considered as a component: it is neither a machine nor a device ready for use in accordance with European directives (machinery directive and electromagnetic compatibility directive). It is the responsibility of the end user to ensure that the machine meets these standards.

The drive must not be used as a safety device for machines posing a potential risk of material damage or personal injury (lifting equipment, for example). In such applications, overspeed checks and checks to ensure that the trajectory remains under constant control must be made by separate devices which are independent of the drive.

The products and equipment described in this document may be changed or modified at any time, either from a technical point of view or in the way they are operated. Their description can in no way be considered contractual.

## Steps for setting up the starter

## 1 - Delivery of the drive

- Check that the drive reference printed on the label is the same as that on the delivery note corresponding to the purchase order.
- Remove the ATV 31 from its packaging and check that it has not been damaged in transit.

2 - Check that the line voltage is compatible with the supply voltage range of the drive (see the ATV 31Installation Manual).

- The drive may be damaged if the line voltage is not compatible.

## 3 - Fit the drive

## 4 - Connect the following to the drive:

- The line supply, ensuring that it is:
- compatible with the voltage range of the drive
- switched off
- The motor, ensuring that its coupling corresponds to the line voltage
- The control via the logic inputs
- The speed reference via the logic or analog inputs

## 5 - Switch on the drive, but do not give a run command

6 - Configure the following:
The nominal frequency (bFr) of the motor, if it is different from 50 Hz .

## 7 - Configure the following in the drC- menu:

The motor parameters, only if the factory configuration of the drive is not suitable.

## 8 - Configure the following in the I-O-, CtL- and FUn- menus:

The application functions (only if the factory configuration of the drive is not suitable), for example the control mode: 3-wire, or 2-wire transition detection, or 2-wire level detection, or 2-wire level detection with forward direction priority, or local control for ATV31eeөA.

$\triangle$The user must ensure that the programmed functions are compatible with the wiring diagram used.

## 9 - Set the following in the SEt- menu:

- The ACC (Acceleration) and dEC (Deceleration) parameters
- The LSP (Low speed when the reference is zero) and HSP (High speed when the reference is maximum) parameters
- The ItH parameter (Motor thermal protection)

## 10 - Start the drive

## Practical recommendations

- Preparations can be made for programming the drive by filling in the configuration and settings tables (see page 76 ), in particular when the factory configuration has to be changed.
- It is always possible to return to the factory settings using the FCS parameter in the drC-, I-O-, CtL- and FUn- menus (return to the configuration selected by the CFG parameter).
The assignment of CFG results directly in a return to the selected configuration.
- For simple applications where the factory settings are suitable, the ATV31 is configured so as to be equally robust as the ATV28 factory settings.
- To achieve optimized drive performance in terms of accuracy and response time, it is essential to:
- Enter the values given on the motor rating plate in the Motor control menu drC- (page 23).
- Perform an auto-tune operation with the motor cold and connected, using parameter tUn in the drC-menu (page 24).
(Auto-tuning measures the stator resistance of the motor in order to optimize the control algorithms).
- Adjust parameters FLG and StA in the Settings menu SEt- (page 20).
- To locate the description of a function quickly, use the index of functions on page 81.
- Before configuring a function, read the "Function compatibility" section on pages 14 and 15.

## Factory configuration

## Factory settings

The ATV 31 is factory-set for the most common operating conditions:

- Display: Drive ready (rdY) with motor stopped, and motor frequency with motor running
- Motor frequency (bFr): 50 Hz
- Constant torque application with sensorless flux vector control (UFt = n )
- Normal stop mode on deceleration ramp (Stt = rMP).
- Stop mode in the event of a fault: Freewheel
- Linear ramps (ACC, dEC): 3 seconds
- Low speed (LSP): 0 Hz
- High speed (HSP): 50 Hz
- Motor thermal current $(\mathrm{ItH})=$ nominal motor current (value depending on drive rating)
- Standstill injection braking current $(S d C)=0.7 \times$ nominal drive current, for 0.5 seconds
- Automatic adaptation of the deceleration ramp in the event of overvoltage on braking
- No automatic restarting after a fault
- Switching frequency 4 kHz
- Logic inputs:
- LI1, LI2 (2 directions of operation): 2-wire transition detection control, LII = forward, LI2 = reverse, inactive on ATV 31 eeeeeeA drives (not assigned)
- LI3, LI4: 4 preset speeds (speed $1=$ speed reference or LSP, speed $2=10 \mathrm{~Hz}$, speed $3=15 \mathrm{~Hz}$, speed $4=20 \mathrm{~Hz}$ ).
- LI5 - LI6: Inactive (not assigned)
- Analog inputs:
- Al1: Speed reference 0-10 V, inactive on ATV 31 e00000A (not assigned)
- AI2: Summed speed reference input 0110 V
- AI3: 4-20 mA inactive (not assigned)
- Relay R1: The contact opens in the event of a fault (or drive off)
- Relay R2: Inactive (not assigned)
- Analog output AOC: 0-20 mA inactive (not assigned)

## ATV $3100000 \cdot A$ range

When they leave the factory, ATV 31 eeeee๑A drives are supplied with local control activated: the RUN, STOP buttons and the drive potentiometer are active. Logic inputs LI1 and LI2 and analog input AI1 are inactive (not assigned).

If the above values are compatible with the application, the drive can be used without changing the settings.

## Software enhancements

Since it was first marketed, the ATV 31 has been equipped with additional functions. Software version V1.2 has now been updated to V1.7. This documentation relates to version V1.7.
The software version appears on the rating plate attached to the side of the drive.

## Enhancements to version V1.7 compared with V1.2

## New parameters

Motor control menu

- LF $I_{1}$ : Choice of source configuration for the factory settings function (see page 26).

This parameter is also accessible in the I-O-, CtL-, and FUn- menus (pages $\underline{29}, \underline{41}$ and 65).

## Application functions menu FUn-

- In r : Ramp increment (see page 43)

Fault menu FLt-

- LEE: Configuration of external fault detection (see page 67).

New possible assignments for relays R1 and R2

- Relays R1 and R2 can now be assigned to LI1..LI6. It then returns the value of the selected logic input (see page 28).

## Basic functions

## Drive thermal protection

## Functions:

Thermal protection by PTC probe fitted on the heatsink or integrated in the power module.
Indirect protection of the drive against overloads by tripping in the event of an overcurrent. Typical tripping points:

- Motor current $=185 \%$ of nominal drive current: 2 seconds
- Motor current $=150 \%$ of nominal drive current: 60 seconds

Time
(seconds)

## Drive ventilation

The fan starts up when the drive is powered up then shuts down after 10 seconds if a run command has not been received.
The fan is powered automatically when the drive is unlocked (operating direction + reference). It is powered down a few seconds after the drive is locked (motor speed $<0.2 \mathrm{~Hz}$ and injection braking completed).

## Basic functions

## Motor thermal protection

## Function:

Thermal protection by calculating the $I^{2} \mathrm{t}$.
The protection takes account of self-cooled motors.
1 Caution: The memory of the motor thermal state returns to zero when the drive is disconnected.

## Setup - Preliminary recommendations

## Prior to switching on and configuring the drive

- Check that the line voltage is compatible with the supply voltage range of the drive (see pages 3 and 4 of the ATV 31 Installation Manual). The drive may be damaged if the line voltage is not compatible.
- Ensure the logic inputs are switched off (state 0 ) to prevent accidental starting. Otherwise, an input assigned to the run command may cause the motor to start immediately on exiting the configuration menus.

## With power switching via line contactor

- Avoid operating the contactor frequently (premature ageing of the filter capacitors). Use inputs LII to LI6 to control the drive.
- These instructions are vital for cycles < 60 s , otherwise the load resistor may be damaged.

## User adjustment and extension of functions

If necessary, the display and buttons can be used to modify the settings and to extend the functions described in the following pages. It is very easy to return to the factory settings using the FCS parameter in the drC-, I-O-, CtL- and FUn- menus (set Inl to activate the function, see page $26,30,41$ or 65).
There are three types of parameter:

- Display: Values displayed by the drive
- Setting: Can be changed during operation or when stopped
- Configuration: Can only be modified when stopped and no braking is taking place. Can be displayed during operation.

- Check that changes to the current operating settings do not present any danger. Changes should preferably be made with the drive stopped.

## Start up

Important: In factory settings mode on power-up, or in a manual fault reset or after a stop command, the motor can only be powered once the "forward", "reverse" and "DC injection stop" commands have been reset. If they have not been reset, the drive will display "nSt" but will not start. If the automatic restart function is configured (parameter Atr in the FLt- menu, see page 66), these commands are taken into account without a reset being necessary.

## Test on a low power motor or without a motor

- In factory settings mode, "motor phase loss" detection is active (OPL = YES). To check the drive in a test or maintenance environment without having to switch to a motor with the same rating as the drive (particularly useful in the case of high power drives), deactivate "motor phase loss" detection (OPL = NO).
- Configure the voltage/frequency ratio: UFt = L (drC- menu on page 24)

- Motor thermal protection will not be provided by the drive if the motor current is less than 0.2 times the nominal drive current.

## Using motors in parallel

- Configure the voltage/frequency ratio: UFt = L (drC- menu on page 24)
- Motor thermal protection is no longer provided by the drive. Provide an alternative means of thermal protection on every motor.

## Functions of the display and the keys

- Red LED "DC bus ON"
- Four 7-segment displays - 2 CANopen status LEDs
- Returns to the previous menu or parameter, or increases the displayed value
- Goes to the next menu or parameter, or decreases the displayed value

- Pressing $\nabla$ or does not store the selection.
- Press and hold down (>2 s) or to scroll through the data quickly.

To save and store the selection: ENT
The display flashes when a value is stored.
Normal display, with no fault present and no starting:

- 43.0: Display of the parameter selected in the SUP- menu (default selection: motor frequency). In current limit mode, the display flashes.
- init: Initialization sequence
- rdY: Drive ready
- dcb: DC injection braking in progress
- nSt: Freewheel stop
- FSt: Fast stop
- tUn: Auto-tuning in progress

The display flashes to indicate the presence of a fault.

## Functions of the display and the keys

## ATV31000000A:

- Red LED
"DC bus ON"
- Four 7-segment displays
- Returns to the previous menu or parameter, or increases the displayed value
- Goes to the next menu or parameter, or decreases the displayed value
- Reference potentiometer, active if the Fr 1 parameter in the CtL- menu is configured as AIP
- RUN button: Controls motor
 switch-on in forward mode, if parameter tCC in the I-O-menu is configured as LOC 2 CANopen status LEDs
- Exits a menu or a parameter, or clears the displayed value to return to the previous stored value

Enters a menu or a parameter, or saves the displayed parameter or value

STOP/RESET button

- Used to reset faults
- Can be used to control motor stopping
- If tCC (I-O-menu) is not configured as LOC, it is a freewheel stop.
- If tCC (I-O-menu) is configured as LOC, stopping is on a ramp, but if injection braking is in progress, a freewheel stop takes place.
- Pressing or does not store the selection.
- Press and hold down (>2 s) or $\nabla$ to scroll through the data quickly.

To save and store the selection: ENT
The display flashes when a value is stored.

## Normal display, with no fault present and no starting:

- 43.0: Display of the parameter selected in the SUP- menu (default selection: output frequency applied to the motor). In current limit mode, the display flashes.
- init: Initialization sequence
- rdY: Drive ready
- dcb: DC injection braking in progress
- nSt: Freewheel stop
- FSt: Fast stop
- tUn: Auto-tuning in progress

The display flashes to indicate the presence of a fault.

## Remote terminal option

This module is a local control unit which can be mounted on the door of the wall-mounted or floor-standing enclosure. It has a cable with connectors, which is connected to the drive serial link (see the manual supplied with the terminal). It has the same display and the same programming buttons as the ATV 31 with the addition of a switch to lock access to the menus and three buttons for controlling the drive:

- FWD/REV: reversal of the direction of rotation
- RUN: motor run command
- STOP/RESET: Motor stop command or fault reset

Pressing the button a first time stops the motor, and if DC injection standstill braking is configured, pressing it a second time stops this braking.

View of the front panel:

Note: Customer password protection has priority on the switch.

- The access locking switch on the remote terminal also prevents the drive settings being accessed via the keypad.
- When the remote terminal is disconnected, if the drive has been locked, the keypad will remain locked.
- In order for the remote terminal to be active, the tbr parameter in the COM- menu must remain in factory settings mode: 19.2 (see page 79).

## Saving and loading configurations

Up to four complete configurations for ATV 31 drives can be stored on the remote terminal. These configurations can be saved, transported and transferred from one drive to another of the same rating. 4 different operations for the same device can also be stored on the terminal. See the SCS and FCS parameters in the drC-, I-O-, CtL- and FUn- menus.

## Programming

## Access to menus

Some parameters can be accessed in a number of menus for increased user-friendliness:

- Entering settings
- Return to factory settings
- Restoring and saving the configuration

A dash appears after menu and sub-menu codes to differentiate them from parameter codes. Examples: FUn- menu, ACC parameter.

## Programming

## Accessing menu parameters

To save and store the selection: ${ }^{\mathbb{E} N T}$
The display flashes when a value is stored.
Example:

(Next parameter)

All the menus are "drop-down" type menus, which means that after the last parameter, if you continue to press $\nabla$, you will return to the first parameter and, conversely, you can switch from the first parameter to the last parameter by pressing $\mathbf{\Delta}$

If, after modifying any of the parameters ( $n^{\text {th }}$ ), you quit a menu and return to this menu without having accessed another menu in the meantime, you will be taken directly to the $\mathrm{n}^{\text {th }}$ parameter (see below). If, in the meantime, you have accessed another menu or have restarted the system, you will always be taken to the first parameter in the menu (see above).

## Configuration of the bFr parameter

This parameter can only be modified in stop mode without a run command.
bFr

| Code | Description | Adjustment range | Factory setting |
| :---: | :--- | :--- | :--- |
| $\mathbf{b F r}$ | Standard motor frequency | 50 |  |
|  | This parameter is only visible the first time the drive is switched on. <br> It can be modified at any time in the drC- menu. <br> $50 \mathrm{~Hz}: ~ I E C$ <br> 60 Hz: NEMA <br> This parameter modifies the presets of the following parameters: HSP page 19, Ftd page 22, FrS page 23 and tFr <br> page 25. |  |  |

## Function compatibility

## Incompatible functions

The following functions will be inaccessible or deactivated in the cases described below:

## Automatic restart

This is only possible for 2-wire level detection control ( $\mathrm{tCC}=2 \mathrm{C}$ and $\mathrm{tCt}=\mathrm{LEL}$ or PFO).

## Flying restart

This is only possible for 2-wire level detection control ( $\mathrm{tCC}=2 \mathrm{C}$ and $\mathrm{tCt}=\mathrm{LEL}$ or PFO).
This function is locked if automatic standstill injection is configured as DC (AdC=Ct).
Reverse
On the ATV3 1000 A range only, this function is locked if local control is active (tCC = LOC).

## Function compatibility table

The choice of application functions may be limited by the number of $I / O$ and by the fact that some functions are incompatible with one another. Functions which are not listed in this table are fully compatible.
If there is an incompatibility between functions, the first function configured will prevent the remainder being configured.
To configure a function, first check that functions which are incompatible with it are unassigned, especially those which are assigned in the factory settings.

|  |  | $\begin{aligned} & \text { I } \\ & \text { O} \\ & 0 \\ & 0 \\ & 0 \\ & 0 \\ & 1 \\ & \hline \end{aligned}$ |  |  |  | $\begin{aligned} & \text { C } \\ & .0 \\ & 0 \\ & 0 \\ & 0 \\ & 0 \\ & 0 \\ & 0 \\ & 0 \end{aligned}$ |  |  | $\begin{aligned} & \circ \\ & \stackrel{0}{0} \\ & \stackrel{\omega}{\omega} \\ & \stackrel{N}{\omega} \\ & \sim \end{aligned}$ |  |

(1)Excluding special application with reference channel Fr2 (see diagrams $\underline{33}$ and $\underline{35}$ )

Priority functions (functions which cannot be active simultaneously):

Stop functions have priority over run commands.
Speed references via logic command have priority over analog references.

## Function compatibility

## 4. Logic and analog input application functions

Each of the functions on the following pages can be assigned to one of the inputs.
A single input can activate several functions at the same time (reverse and $2^{\text {nd }}$ ramp for example). The user must therefore ensure that these functions can be used at the same time.

The SUP- display menu (parameters LIA and AIA on page $\mathbf{7 2}$ ) can be used to display the functions assigned to each input in order to check their compatibility.

Before assigning a reference, a command or a function to a logic or analog input, check that this input has not already been assigned in the factory settings, and that no other input has been assigned to an incompatible or unwanted function.

- Example of incompatible function to be unassigned:
activate " $+/-$ speed", first unassign the preset speeds and summing input 2.
- Example of unwanted function to be unassigned:
control an ATV31e0eA at the terminals it is advisable to unassign the potentiometer and the RUN button.
The following table indicates the factory-set input assignments and the procedure for unassigning them.
$\left.\begin{array}{|l|l|l|l|l|l|}\hline \begin{array}{l}\text { Assigned input } \\ \text { ATV3 } 1 \boldsymbol{\bullet e \bullet}\end{array} & \text { ATV3 1 } \bullet \bullet \bullet A\end{array}\right)$

## Settings menu SEt－

The adjustment parameters can be modified with the drive running or stopped．
Check that it is safe to make changes during operation．Changes should preferably be made in stop mode．
These parameter appear regardless of how the other menus have been configured．

These parameters only appear if the corresponding function has been selected in another menu．When the corresponding function is also accessible and adjustable from within the configuration menu，to aid programming their description is detailed in these menus，on the pages indicated．

| Code | Description |  | Adjustment range | Factory setting |
| :---: | :---: | :---: | :---: | :---: |
| LFr | Speed reference via the remote terminal |  | 0 to HSP |  |
|  | This parameter appears if LCC＝YES（page 40）or if Fr1／Fr2＝LCC（page 38），and if the remote terminal is online．In this case，LFr can also be accessed via the drive keypad． <br> LFr is reset to 0 when the drive is powered down． |  |  |  |
| $r P 1$ | Internal PI regulator reference | See page 57 | 0.0 to 100\％ | 0 |
| A［［ | Acceleration ramp time |  | according to parameter Inr （See page 43） | 3 s |
|  | Defined as the acceleration time between 0 and the nominal frequency FrS（parameter in the drC－menu）． |  |  |  |
| A［2 | $2^{\text {nd }}$ acceleration ramp time | See page 44 | according to parameter Inr （See page 43） | 5 s |
| $d E 2$ | $2^{\text {nd }}$ deceleration ramp time | See page 44 | according to parameter Inr （See page 43） | 5 s |
| $d E[$ | Deceleration ramp time |  | according to parameter Inr （See page 43） | 3 s |
|  | Defined as the deceleration time between the nominal frequency FrS（parameter in the drC－menu）and 0. Check that the value of dEC is not too low in relation to the load to be stopped． |  |  |  |
| ER I | Start of CUS－type acceleration ramp rounded as \％of total ramp time（ACC or AC2） | See page 42 | O to 100 | 10\％ |
| ヒ月 | End of CUS－type acceleration ramp rounded as \％of total ramp time（ACC or AC2） | See page 42 | 0 to（100－tA1） | 10\％ |
| ヒ 月 ヨ | Start of CUS－type deceleration ramp rounded as \％of total ramp time（dEC or dE2） | See page 42 | 0 to 100 | 10\％ |
| ER4 | End of CUS－type deceleration ramp rounded as \％of total ramp time（dEC or dE2） | See page 42 | 0 to（100－tA3） | 10\％ |
| $L 5 P$ | Low speed |  | 0 to HSP | OHz |
|  | （Motor frequency at min．reference） |  |  |  |
| H 5 P | High speed |  | LSP to tFr | bFr |
|  | （Motor frequency to max．reference）：Check that this setting is suitable for the motor and the application． |  |  |  |

(1)In corresponds to the nominal drive current indicated in the Installation Manual and on the drive rating plate.
(2)Caution: These settings are not related to the "automatic standstill DC injection" function.

These parameters only appear if the corresponding function has been selected in another menu. When the corresponding function is also accessible and adjustable from within the configuration menu, to aid programming their description is detailed in these menus, on the pages indicated.
Those which are underlined appear in factory settings mode.

| Code | Description | Adjustment range | Factory setting |
| :---: | :--- | :--- | :--- |
| $J P F$ | Skip frequency | 0 to 500 | 0 Hz |

（1）In corresponds to the nominal drive current indicated in the Installation Manual and on the drive rating plate．
These parameters only appear if the corresponding function has been selected in another menu．When the corresponding function is also accessible and adjustable from within the configuration menu，to aid programming their description is detailed in these menus，on the pages indicated．
Those which are underlined appear in factory settings mode．

| Code | Description | Adjustment range | Factory setting |
| :---: | :---: | :---: | :---: |
| Ftd | Motor frequency threshold above which the relay contact (R1 or R2 = FtA) closes or output AOV = $10 \mathrm{~V}(\mathrm{dO}=\mathrm{StA})$ | 0 to 500 Hz | bFr |
| tEd | Motor thermal state threshold above which the relay contact ( R 1 or $\mathrm{R} 2=\mathrm{tSA})$ closes or output $\mathrm{AOV}=10 \mathrm{~V}(\mathrm{dO}=\mathrm{tSA})$ | O to 118\% | 100\% |
| ctd | Motor current threshold beyond which the relay contact (R1 or R2 = CtA) closes or output AOV $=10 \mathrm{~V}(\mathrm{dO}=\mathrm{CtA})$ | 0 to $1.5 \ln (1)$ | $\ln (1)$ |
| 5d5 | Scale factor for display parameter SPd1/SPd2/SPd3 (SUP- menu on page 71) | 0.1 to 200 | 30 |
|  | Used to scale a value in proportion to the output frequency rFr: the machine speed, the motor speed, etc. <br> - If SdS $\leqslant 1, S P d 1$ is displayed (possible definition $=0.01$ ) <br> - If $1<$ SdS $\leqslant 10$, SPd2 is displayed (possible definition $=0.1$ ) <br> - If SdS > 10, SPd3 is displayed (possible definition = 1) <br> - If SdS > 10 and $\mathrm{SdS} \times \mathrm{rFr}>9999$ : <br> Display of Spd3 $=\frac{\mathrm{SdS} \times \mathrm{rFr}}{1000}$ to 2 decimal places <br> Example: For 24 223, display is 24.22 <br> - If SdS > 10 and $\mathrm{SdS} \times \mathrm{rFr}>65535$, display locked at 65.54 <br> Example: Display motor speed for <br> 4-pole motor, 1500 rpm at 50 Hz (synchronous speed): <br> SdS = 30 <br> SPd3 $=1500$ at $r F r=50 \mathrm{~Hz}$ |  |  |
| 5 Fr | Switching frequency See page 25 | 2.0 to 16 kHz | 4 kHz |
|  | This parameter can also be accessed in the drC- menu. |  |  |

(1)In corresponds to the nominal drive current indicated in the Installation Manual and on the drive rating plate.

## Motor control menu drC-

With the exception of $t U n$, which can power up the motor, parameters can only be modified in stop mode, with no run command present.
On the optional remote terminal, this menu can be accessed with the switch in the $\square$ position.
Drive performance can be optimized by:

- Entering the values given on the motor rating plate in the drive menu
- Performing an auto-tune operation (on a standard asynchronous motor)

| Code | Description | Adjustment range | Factory setting |
| :---: | :---: | :---: | :---: |
| $b F r$ | Standard motor frequency |  | 50 |
|  | 50 Hz : IEC <br> 60 Hz : NEMA <br> This parameter modifies the presets of the following parameters: HSP page 19, Ftd page $\underline{22}$, FrS page $\underline{23}$ and tFr page 25. |  |  |
| U $\cap 5$ | Nominal motor voltage given on the rating plate | According to drive rating | According to drive rating |
|  | ATV3 1 eeeM2: 100 to 240 V ATV3 1 eeeM3X: 100 to 240 V ATV31eeoN4: 100 to 500 V ATV3 $1 e \bullet e S 6 X: 100$ to 600 V |  |  |
| $F r 5$ | Nominal motor frequency given on the rating plate | 10 to 500 Hz | 50 Hz |
|  | $\triangle$ <br> The ratio <br> $\frac{\text { UnS (in volts) }}{\text { FrS (in } \mathrm{Hz} \text { ) }}$ must not exceed the following values: <br> ATV3 1 eeeM2: 7 max. <br> ATV31e0@M3X: 7 max. <br> ATV31000N4: 14 max. <br> ATV3 1 eeeS6X: 17 max. <br> The factory setting is 50 Hz , or preset to 60 Hz if bFr is set to 60 Hz . |  |  |
| $n[r$ | Nominal motor current given on the rating plate | 0.25 to $1.5 \ln (1)$ | According to drive rating |
| $n 5 P$ | Nominal motor speed given on the rating plate | 0 to 32760 RPM | According to drive rating |
|  | 0 to 9999 RPM then 10.00 to 32.76 KRPM <br> If, rather than the nominal speed, the rating plate indicates the synchronous speed and the slip in Hz or as a \%, calculate the nominal speed as follows: <br>  |  |  |
| [ 05 | Motor Cos Phi given on the rating plate | 0.5 to 1 | According to drive rating |

(1)In corresponds to the nominal drive current indicated in the Installation Manual and on the drive rating plate.

(1)Procedure:

- Check that the motor is cold.
- Disconnect the cables from the motor terminals.
- Measure the resistance between 2 of the motor terminals (U. V. W) without modifying its connection.
- Use the $\boldsymbol{\nabla}$ keys to enter half the measured value.
- Increase the factory setting of UFr (page 20) to $100 \%$ rather than $20 \%$.

| Code | Description | Adjustment range | Factory setting |
| :---: | :---: | :---: | :---: |
| nrd | Random switching frequency |  | YES |
|  | YE 5: Frequency with random modulation <br> $\cap \square$ : Fixed frequency <br> Random frequency modulation prevents any resonance which may occur at a fixed frequency. |  |  |
| 5 Fr | Switching frequency (1) | 2.0 to 16 kHz | 4 kHz |
|  | The frequency can be adjusted to reduce the noise generated by the motor. If the frequency has been set to a value higher than 4 kHz , in the event of an excessive rise in temperature, the drive will automatically reduce the switching frequency and increase it again once the temperature has returned to normal. |  |  |
| EFr | Maximum output frequency | 10 to 500 Hz | 60 Hz |
|  | The factory setting is 60 Hz , or preset to 72 Hz if bFr is set to 60 Hz . |  |  |
| $5 r F$ | Suppression of the speed loop filter |  | nO |
|  | $n \square$ : The speed loop filter is active (prevents the reference being exceeded). YE 5: The speed loop filter is suppressed (in position control applications, this reduces the response time and the reference may be exceeded). |  |  |

(1)SCS and FCS can be accessed via several configuration menus but they concern all menus and parameters as a whole.
(2)Parameter can also be accessed in the settings menu (SEt-).

| de | Description | Adjustment range | tory settin |
| :---: | :---: | :---: | :---: |
| [ F L | Source confi |  | Std |
|  | Choice of source configuration. <br> 5 t 5: Run/stop configuration. <br> Identical to the factory configuration apart from the I/O assignments: <br> - Logic inputs: <br> - LII, LI2 (2 directions of operation): 2-wire transition detection control, LI1 = forward, LI2 = reverse, inactive on ATV $3100000 \cdot$ A drives (not assigned) <br> - LI3 to LI6: Inactive (not assigned) <br> - Analog inputs: <br> - Al1: Speed reference 0-10 V, inactive on ATV $3100000 \bullet$ A drives (not assigned) <br> - AI2, A13: Inactive (not assigned) <br> - Relay R1: The contact opens in the event of a fault (or drive switched off) <br> - Relay R2: Inactive (not assigned) <br> - Analog output AOC: 0-20 mA inactive (not assigned) <br> - 5 t d: Factory configuration (see page 4). <br> The assignment of CFG results directly in a return to the selected configuration. |  |  |
| F [ 5 | Return to factory settings/restore configuration (1) |  | no |
|  | $n \square:$ Function inactive <br> r E [ I: The current configuration becomes identical to the backup configuration previously saved by SCS = Strl. rECI is only visible if the backup has been carried out. FCS automatically changes to nO as soon as this action has been performed. <br> In I : The current configuration is replaced by the configuration selected by parameter CFG (2). FCS automatically changes to nO as soon as this action has been performed. <br> - If the remote terminal option is connected to the drive, the following additional selection options appear, as long as the corresponding files have been loaded in the remote terminal's EEPROM memory ( 0 to 4 files): $F I L \quad I, F I L 己, F I L \exists, F I L 4$. They enable the current configuration to be replaced with one of the 4 configurations which may be loaded on the remote terminal. FCS automatically changes to nO as soon as this action has been performed. Caution: If $n A d$ appears on the display briefly once the parameter has switched to nO, this means that the configuration transfer is not possible and has not been performed (different drive ratings for example). If $n t r$ appears on the display briefly once the parameter has switched to $n \mathrm{O}$, this means that a configuration transfer error has occurred and the factory settings must be restored using Inl. In both cases, check the configuration to be transferred before trying again. |  |  |

For rECI, InI and FL1 to FL4 to be taken into account, the ENT key must be held down for 2 s .
(1)(SCS, CFG and FCS can be accessed via several configuration menus but they concern all menus and parameters as a whole.
(2)The following parameters are not modified by this function, they retain the same configuration:

- bFr (Standard motor frequency) page 23.
- LCC (Control via remote display terminal) page 40.
- COd (Terminal locking code) page 72.
- The parameters in the Communication menu COM-.
- The parameters in the Display menu SUP-.

The parameters can only be modified when the drive is stopped and no run command is present. On the optional remote terminal, this menu can be accessed with the switch in the $\square$ position.

| $5[5$ | Saving the configuration (1) |
|  | n $\square$ : Function inactive <br> $5 \operatorname{tr}$ I: Saves the current configuration (but not the result of auto-tuning) to EEPROM. SCS automatically switches to nO as soon as the save has been performed. This function is used to keep another configuration in reserve, in addition to the current configuration. <br> When drives leave the factory the current configuration and the backup configuration are both initialized with the factory configuration. <br> - If the remote terminal option is connected to the drive, the following additional selection options will appear: FIL I,FIL L,FIL ヨ,FIL 4 (files available in the remote terminal's EEPROM memory for saving the current configuration). They can be used to store between 1 and 4 different configurations which can also be stored on or even transferred to other drives of the same rating. SCS automatically switches to nO as soon as the save has been performed. <br> For Strl and FIL2 to FIL4 to be taken into account, the ENT key must be held down for 2 s . |
| CFL | Source configuration ${ }^{\text {atd }}$ |
|  | Choice of source configuration. <br> 5 t 5: Run/stop configuration. <br> Identical to the factory configuration apart from the I/O assignments: <br> - Logic inputs: <br> - LI1, LI2 (2 directions of operation): 2-wire transition detection control, LI1 = forward, LI2 = reverse, inactive on ATV 31 e00000A drives (not assigned) <br> - LI3 to LI6: Inactive (not assigned) <br> - Analog inputs: <br>  <br> - AI2, A13: Inactive (not assigned) <br> - Relay R1: The contact opens in the event of a fault (or drive switched off) <br> - Relay R2: Inactive (not assigned) <br> - Analog output AOC: 0-20 mA inactive (not assigned) <br> - 5 t d: Factory configuration (see page 4). <br> The assignment of CFG results directly in a return to the selected configuration. |

(1)SCS, CFG and FCS can be accessed via several configuration menus but they concern all menus and parameters as a whole.

| Code |  |
| :---: | :---: |
| F [ 5 | Return to factory settings/restore configuration (1) |
|  | $\cap \square$ : Function inactive <br> $r E[\quad$ : The current configuration becomes identical to the backup configuration previously saved by SCS = Strl. rECI is only visible if the backup has been carried out. FCS automatically changes to nO as soon as this action has been performed. <br> In $I$ : The current configuration is replaced by the configuration selected by parameter CFG (2). <br> FCS automatically changes to nO as soon as this action has been performed. <br> - If the remote terminal option is connected to the drive, the following additional selection options appear, as long as the corresponding files have been loaded in the remote terminal's EEPROM memory ( 0 to 4 files): F IL I, F IL こ, F IL ヨ, F IL Ч. They enable the current configuration to be replaced with one of the 4 configurations that may be loaded on the remote terminal. <br> FCS automatically changes to nO as soon as this action has been performed. <br> Caution: If $n$ A $d$ appears on the display briefly once FCS has switched to nO, this means that the configuration transfer is not possible and has not been performed (different drive ratings for example). If $n t r$ appears on the display briefly once the parameter has switched to $n \mathrm{O}$, this means that a configuration transfer error has occurred and the factory settings must be restored using Inl. In both cases, check the configuration to be transferred before trying again. |

For rECI, InI and FL1 to FL4 to be taken into account, the ENT key must be held down for 2 s.
(1)(SCS, CFG and FCS can be accessed via several configuration menus but they concern all menus and parameters as a whole.
(2)The following parameters are not modified by this function, they retain the same configuration:

- bFr (Standard motor frequency) page 23.
- LCC (Control via remote display terminal) page 40.
- COd (Terminal locking code) page 72.
- The parameters in the Communication menu COM-.
- The parameters in the Display menu SUP-.

The parameters can only be modified when the drive is stopped and no run command is present.
On the optional remote terminal, this menu can be accessed with the switch in the $\qquad$ position.

## Control and reference channels

Run commands (forward, reverse, etc.) and references can be sent by the following channels:

| Command CMD | Reference rFr |
| :---: | :---: |
| tEr: Terminal (LI.) | AI1-AI2-AI3: Terminal |
| LOC: Keypad (RUN/STOP) on ATV31 0 ( ${ }^{\text {A }}$ only | AIP: Potentiometer on ATV3 1 eeeA only |
| LCC: Remote terminal (RJ45 socket) | LCC: ATV31 keypad or ATV3 1 eeoA keypad or remote terminal |
| Mdb: Modbus (RJ45 socket) | Mdb: Modbus (RJ45 socket) |
| CAn: CANopen (RJ45 socket) | CAn: CANopen (RJ45 socket) |

## Note:

The STOP keys on the keypad and the remote terminal may retain priority (PSt parameter in the CtL-menu).
The LAC parameter in the CtL- menu can be used to select priority modes for the control and reference channels. It has 3 function levels:

- $\mathrm{LAC}=\mathrm{L1}: \quad$ Basic functions, The channels are managed in order of priority. This level is interchangeable with ATV28.
- $L A C=L 2: \quad$ Provides the option of additional functions compared with L1:
- +/- speed (motorized potentiometer)
- Brake control
- Switching for 2nd current limit
- Motor switching
- Management of limit switches
- $L A C=L 3: \quad$ Same options as with $L 2$, Management of the control and reference channels is configurable.

## These channels can be combined as follows if parameter LAC = L1 or L2.

Highest priority to lowest priority: Local forcing, CANopen, Modbus, Remote terminal, Terminal/Keypad (from right to left in the diagram below).

See the detailed diagrams on pages $\underline{33}$ and $\underline{34}$.

- On ATV3 1 drives, in factory settings mode, control and reference are managed by the terminal.
- On ATV3 100 A drives, in factory settings mode, control is via the keypad and the reference is set via the potentiometer for this keypad.
- With a remote terminal, if LCC = YES (CtL-menu), control and reference are managed by the remote terminal (reference via LFr, SEtmenu).

## Control menu CtL-

## The channels can be combined by configuration, if $L A C=L 3$.

## Combined control and reference (parameter CHCF = SIM):

Parameter rFC can be used to select channel Fr1 or Fr2 or to configure a logic input or a control word bit for remote switching of either. See the detailed diagrams on pages 35 et 37 .

## Separate control and reference (parameter CHCF = SEP):

## Reference

Parameter rFC can be used to select channel Fr1 or Fr2 or to configure a logic input or a control word bit for remote switching of either.

## Control

Parameter CCS can be used to select channel Cd1 or Cd2 or to configure a logic input or a control word bit for remote switching of either.
See the detailed diagrams on pages $\underline{35}$ and $\underline{36}$.

## Reference channel for LAC = L1 or L2

Key:

Parameter:
The black square represents the factory setting assignment (1)
(1)Except for ATV31000A: Fr1 is factory-set to AIP

## Control channel for LAC = L1 or L2

Parameters FLO, LCC and the selection of the Modbus or CANopen bus are common to the reference and control channels. Example: LCC = YES sets the drive to control and reference via the remote terminal.

Key:

Parameter:
The black square represents
the factory setting assignment
(1)Except for ATV3 1000 A: tCC is factory-set to LOC.

## Reference channel for LAC $=\mathrm{L} 3$

## Control channel for LAC = L3

## Combined reference and control

Parameters Fr1, Fr2, rFC, FLO and FLOC are common to reference and control. The control channel is therefore determined by the reference channel.
Example: If reference Fr1 = Al1 (analog input on terminal block) control is via LI (logic input on terminal block)..

Key:

Parameter:
The black square represents the factory setting assignment (1)
(1) Except for ATV31ee๗A: Fr1 and FLOC are factory-set to AIP.

## Control menu CtL-

## Control channel for LAC = L3

## Mixed mode (separate reference and control)

Parameters FLO and FLOC are common to reference and control.
Example: If the reference is in local forced mode via Al1 (analog input on terminal block) control in local forced mode is via LI (logic input on terminal block).

Key:

Parameter:
The black square represents the factory setting assignment (1)
(1) Except for ATV31eeゃA: Cd1 is factory-set to LOC.

## Control menu CtL－

There may be an incompatibility between functions（see the incompatibility table in page 14）．In this case，the first function configured will prevent the remainder being configured．

| Code | Description ${ }^{\text {a }}$ Adjustment range | Factory setting |
| :---: | :---: | :---: |
| L AL | Function access level | L1 |
|  | L I：Access to standard functions．Significantly，this level is interchangeable with ATV28． <br> $L 己$ ：Access to advanced functions in the FUn－menu： <br> －＋／－speed（motorized potentiometer） <br> －Brake control <br> －Switching for second current limit <br> －Motor switching <br> －Management of limit switches <br> $L \exists$ ：Access to advanced functions and channel management by configuration． <br> Assigning LAC to L3 will restore the factory settings of the Fr1（below），Cd1（page 39），CHCF （page 39），and tCC（page 27）parameters．The latter is forced to＂2C＂on ATV31•e0A． L3 can only be restored to L2 or L1 and L2 to L1 by means of a＂factory setting＂via FCS（page 41）． <br> In order to change the assignment of LAC，you must press and hold down the＂ENT＂key for 2 seconds． |  |
| Fr I | Configuration reference 1 | Al1 AIP for ATV31000A |

| $F r ?$ | Configuration reference 2 | no |
|  | $\sqcap \square$ ：Not assigned <br> A I I：Analog input Al1 <br> A I ᄅ：Analog input AI2 <br> A I ヨ：Analog input AI3 <br> A IP：Potentiometer（ATV31eeッA only） <br> If LAC $=\mathrm{L} 2$ or L3，the following additional assignments are possible： <br> $\triangle P d E:(1)+$ speed／－speed via Ll．See configuration page 54. <br> $U P d H:(1)+$ speed／－speed via keys $\boldsymbol{\Delta} \nabla$ on the ATV31 or ATV31e0eA keypad or operation，display the frequency $r \mathrm{Fr}$（see page 71）．The $+/$－speed function via the ke terminal is controlled from the SUP－menu by setting to parameter rFr ． <br> If LAC $=\mathrm{L} 3$ ，the following additional assignments are possible： <br> $L[C$ ：Reference via the remote terminal，LFr parameter in the SEt－menu page 19. <br> Пdb：Reference via Modbus <br> ［ $\mathrm{H}_{\mathrm{n}}$ ：Reference via CANopen | ote terminal．For d or display |

## （1）CAUTION：

－You cannot assign UPdt to Fr1 or Fr2 and UPdH to Fr1 or Fr2 at the same time．Only one of the UPdt／UPdH assignments is permitted on each reference channel．
－The＋／－speed function in Fr 1 is incompatible with several functions（see page 14）．Before configuring it，these functions must be unassigned，especially the summing inputs（set SA2 to nO page 48）and the preset speeds（set PS2 and PS4 to nO page 50 ）which are assigned in the factory settings．
（2）In Fr2，the $+/-$ speed function is compatible with the preset speeds，summing inputs and the PI regulator．

| Code | Description | Adjustment range | Factory setting |

| P5t | Stop priority |  | YES |
|  | This function gives priority to the STOP key on the keypad（ATV3 1000 A only）or the STOP key on the remote terminal，regardless of the control channel（terminal block or communication bus）． <br> $\rightarrow \square:$ Function inactive <br> YE S：STOP key priority <br> In order to change the assignment of PSt，you must press and hold down the＂ENT＂key for 2 seconds． |  |  |
| $r \square t$ | Direction of operation authorized |  | dFr |
|  | Direction of operation authorized for the RUN key on the keypad（ATV3 1 eeeA only）or the RUN key on the remote terminal． <br> $d F_{r}$ ：Forward <br> dr 5：Reverse <br> $b \square E$ ：Both directions are authorized（except for the keypad on the ATV3 $1 \bullet \bullet \bullet$ A：Forward only）． |  |  |

These parameters only appear if the function has been enabled．

(1)SCS, CFG and FCS can be accessed via several configuration menus but they concern all menus and parameters as a whole.
(2)The following parameters are not modified by this function, they retain the same configuration:

- bFr (Standard motor frequency) page 23.
- LCC (Control via remote display terminal) page 40.
- COd (Terminal locking code) page 72.
- The parameters in the Communication menu COM-.
- The parameters in the Display menu SUP-.

The parameters can only be modified when the drive is stopped and no run command is present. On the optional remote terminal, this menu can be accessed with the switch in the $\square$ position.

Some functions have numerous parameters. In order to clarify programming and avoid having to scroll through endless parameters, these functions have been grouped in sub-menus. Like menus, sub-menus are identified by a dash after their code: PSS- $\quad$ for example.

There may be an incompatibility between functions (see the incompatibility table 14). In this case, the first function configured will prevent the remainder being configured.

| Code |  | Description | Adjustment range | Factory setting |
| :---: | :---: | :---: | :---: | :---: |
| rPC- |  | Ramps |  |  |
|  | $r P t$ | Type of ramp Defines the shape of the acceleration and deceleration ramps. |  | LIn |
|  |  | LIn:Linear <br> 5: S ramp <br> U: U ramp <br> ᄃ ப 5: Customized <br> The curve coefficient is fixed, with $\mathrm{t} 2=0.6 \times \mathrm{t} 1$ <br> with $\mathrm{t} 1=$ set ramp time. <br> Customized ramps <br> tA1: Can be set between 0 and $100 \%$ (of ACC or AC2) <br> tA2: Can be set between 0 and (100\% - tA1) (of ACC or AC2) <br> tA3: Can be set between 0 and $100 \%$ (of dEC or dE2) tA4: Can be set between 0 and (100\% - tA3) (of dEC or dE2) |  |  |
|  | E A I | Start of CUS-type acceleration ramp rounded as \% of total ramp time (ACC or AC2) | O to 100 | 10\% |

These parameters only appear if the function has been enabled.

(1)When values higher than 9999 are displayed on the drive or on the remote terminal, a dot is displayed after the thousands digit.

This type of display can lead to confusion between values which have two digits after the decimal point and values higher than 9999.

Check the value of the parameter Inr.
Example:
-If $\operatorname{Inr}=0.01$, the value 15.65 corresponds to a setting of 15.65 s .
-If $\operatorname{lnr}=1$, the value 15.65 corresponds to a setting of 15650 s .
(2)Parameter can also be accessed in the SEt- menu.

These parameters only appear if the function has been enabled.

| Code |  | Description |  |  | Adjustment range | Factory setting |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{array}{\|c\|} \hline r P C- \\ \text { (continued) } \end{array}$ | Frt | Ramp switching threshold |  |  | 0 to 500 Hz | 0 |
|  |  | The second ramp is switched if the value of Frt is not equal to 0 ( 0 deactivates the function) and the output frequency is greater than Frt. Threshold ramp switching can be combined with switching via LI or bit as follows: |  |  |  |  |
|  |  | Ll or bit | Frequency | Ramp |  |  |
|  |  | $\underline{0}$ | < Frt | ACC, dEC |  |  |
|  |  | $\bigcirc$ | $\geq \mathrm{Frt}$ | AC2, dE2 |  |  |
|  |  | 1 | $\stackrel{\text { crit }}{ }$ | AC2, dE2 |  |  |
|  | H[2 | $2^{\text {nd }}$ acceleration ramp time (1): <br> Enabled via logic input (rPS) or frequency threshold (Frt). |  |  | according to the value of parameter Inr (see page 43) | 5 s |
|  | dE 2 | $2^{\text {nd }}$ deceleration ramp time (1): <br> Enabled via logic input (rPS) or frequency threshold (Frt). |  |  | according to the value of parameter Inr (see page 43) | 5 s |
|  | brA | Deceleration ramp adaptation |  |  |  | YES |
|  |  | Activating this function automatically adapts the deceleration ramp, if this has been set at too low a value for the inertia of the load. <br> n $\square$ : Function inactive <br> $\Psi E 5$ : Function active. The function is incompatible with applications requiring: <br> - Positioning on a ramp <br> - The use of a braking resistor (no guarantee of the function operating correctly) brA is forced to nO if brake control (bLC) is assigned (page 60). |  |  |  |  |

(1)Parameter can also be accessed in the SEt- menu.

These parameters only appear if the function has been enabled.

[^0]

| Code |  | Description | Adjustment range | Factory setting |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} 5 E L- \\ \text { (continued) } \end{gathered}$ | $1 d[$ | Level of DC injection braking current activated via logic input or selected as stop mode (1)(3) | 0 to In (2) | $0.7 \ln$ (2) |
|  |  | After 5 seconds the injection current is peak limited at 0.5 Ith if it is set at a higher value. |  |  |
|  | $t d[$ | Total DC injection braking time selected as normal stop mode (1)(3) | 0.1 to 30 s | 0.5 s |
|  | $\cdots 5 t$ | Freewheel stop via logic input |  | nO |

If the input falls back to state 1 and the run command is still active, the motor will only restart if 2 -wire level control has been configured. In other cases, a new run command must be sent. |  |  |

(1)Parameter can also be accessed in the settings menu (SEt-).
(2)In corresponds to the nominal drive current indicated in the Installation Manual and on the drive rating plate.
(3)Caution: These settings are not related to the "automatic standstill DC injection" function.

These parameters only appear if the function has been enabled.

(1)Parameter can also be accessed in the settings menu (SEt-).
(2)In corresponds to the nominal drive current indicated in the Installation Manual and on the drive rating plate.

These parameters only appear if the function has been enabled.

## Summing inputs

## Note:

Al2 is an input 110 V , which can allow a subtraction by summing a negative signal.

See the complete diagrams on pages $\underline{33}$ and $\underline{35}$.

Application functions menu FUn-

## Preset speeds

$2,4,8$ or 16 speeds can be preset, requiring $1,2,3$ or 4 logic inputs respectively.
The following order of assignments must be observed: PS2, then PS4 then PS8, then PS16.
Combination table for preset speed inputs

| $\begin{aligned} & 16 \text { speeds } \\ & \text { LI (PS } 16 \text { ) } \end{aligned}$ | $\frac{8 \text { speeds }}{\text { LI (PS8) }}$ | $\begin{aligned} & 4 \text { speeds } \\ & \text { LI (PS4) } \end{aligned}$ | $\begin{aligned} & 2 \text { speeds } \\ & \text { LI (PS2) } \end{aligned}$ | Speed reference |

(1)See the diagrams on page $\underline{33}$ and page $\underline{35}$ : Reference $1=(S P 1)$.

(1)Parameter can also be accessed in the settings menu (SEt-).
(2)Note: The speed is always limited by parameter HSP (page 19).

These parameters only appear if the function has been enabled.

(1)Parameter can also be accessed in the settings menu (SEt-).

[^1]
## Application functions menu FUn-

## +/- speed

The function can only be accessed if LAC $=\mathrm{L} 2$ or L 3 (see page 38 ).
Two types of operation are available.
1 Use of single action buttons: Two logic inputs are required in addition to the operating direction(s).
The input assigned to the "+ speed" command increases the speed, the input assigned to the "- speed" command decreases the speed.
Note: If the "+ speed" command and the "- speed" command are activated at the same time, the "- speed" command takes priority.
2 Use of double action buttons: Only one logic input assigned to "+ speed" is required.

+ speed/- speed with double action buttons:

Description: 1 button pressed twice for each direction of rotation. Each action closes a contact.

|  | Released (- speed) |  | $\begin{array}{c}\mathbf{1}^{\text {st }} \text { press } \\ \text { (speed maintained) }\end{array}$ |
| :--- | :---: | :---: | :---: |
| Forward button | $=$ | $\underline{2^{\text {nd }}}$ press |  |
| (+ speed) |  |  |  |$]$

Example of wiring:
LI1: forward
LIx: reverse
Lly: + speed

This type of $+/$ - speed is incompatible with 3 -wire control.
Whichever type of operation is selected, the max. speed is set by HSP (see page 19)

## Note:

If the reference is switched via rFC (see page 39) from any reference channel to another with " $+/$ - speed" the value of reference rFr (after ramp) is copied at the same time. This prevents the speed being incorrectly reset to zero when switching takes place.

Associated with the "+/-speed" function, this parameter can be used to save the reference:

- When the run commands disappear (saved to RAM)
- When the mains supply or the run commands disappear (saved to EEPROM)

On the next start-up, the speed reference is the last reference saved.
$\rightarrow \square:$ No save
r $A$ П: Save to RAM
E E P: Save to EEPROM

These parameters only appear if the function has been enabled.

## PI regulator

## Diagram

The function is activated by assigning an analog input to the PI feedback (measurement).

Pages $\mathbf{3 3}$ and $\underline{35}$
PI feedback:
The PI feedback must be assigned to one of the analog inputs (AI1, AI2 or AI3).
PI reference:
The PI reference can be assigned to the following parameters in order of priority:

- Preset references via logic inputs (rP2, rP3, rP4)
- Internal reference (rPI)
- Reference Fr1 (see page 38)

Combination table for preset PI references

| LI (Pr4) | $\underline{\text { LI (Pr2) }}$ | $\underline{\text { Pr2 = nO }}$ | Reference |
| :---: | :---: | :---: | :---: |
|  |  |  | $\underline{\text { rPI or Fr1 }}$ |
| $\underline{0}$ | $\underline{0}$ |  | $\underline{\text { rPI or Fr1 }}$ |
| $\underline{0}$ | $\underline{1}$ |  | $\underline{r P 2}$ |
| $\underline{1}$ | $\underline{0}$ | $\underline{r P 3}$ |  |
| 1 | $\underline{1}$ |  | $\underline{r P 4}$ |

Parameters which can be accessed in the settings menu (SEt-):

- Internal reference (rPI)
- Preset references (rP2, rP3, rP4)
- Regulator proportional gain (rPG)
- Regulator integral gain (rIG)
- FbS parameter:

The FbS parameter can be used to scale the reference on the basis of the variation range of the Pl feedback (sensor rating).
E.g.: Pressure control

PI reference (process) 0-5 bar (0-100\%)
Rating of pressure sensor 0-10 bar
FbS = Max. sensor scale/Max. process
$\mathrm{FbS}=10 / 5=2$

- rSL parameter:

Can be used to set the PI error threshold above which the PI regulator will be reactivated (wake-up) after a stop due to the max. time threshold being exceeded at low speed (tLS).

- Reversal of the direction of correction (PIC): If PIC = nO, the speed of the motor will increase when the error is positive, for example: pressure control with a compressor. If PIC $=$ YES, the speed of the motor will decrease when the error is positive, for example: temperature control via a cooling fan.

## "Manual - Automatic" operation with PI

This function combines the PI regulator and the switching of reference rFC (page 39). The speed reference is given by Fr2 or by the PI function, depending on the state of the logic input.

## Setting up the PI regulator

1 Configuration in PI mode
See the diagram on page $5 \mathbf{5}$.
2 Perform a test in factory settings mode (in most cases, this will be sufficient).
To optimize the drive, adjust rPG or rIG gradually and independently and observe the effect on the PI feedback in relation to the reference.

## 3 If the factory settings are unstable or the reference is incorrect:

Perform a test with a speed reference in Manual mode (without PI regulator) and with the drive on load for the speed range of the system: - In steady state, the speed must be stable and comply with the reference and the PI feedback signal must be stable.

- In transient state, the speed must follow the ramp and stabilize quickly and the PI feedback must follow the speed.

If this is not the case, see the settings for the drive and/or sensor signal and cabling.

## Switch to PI mode.

Set brA to no (no auto-adaptation of the ramp).
Set the speed ramps (ACC, dEC) to the minimum permitted by the mechanics without triggering an ObF fault.
Set the integral gain (rIG) to minimum.
Observe the PI feedback and the reference.
Do several RUN/STOP or vary the load or reference rapidly.
Set the proportional gain (rPG) in order to ascertain the ideal compromise between response time and stability in transient phases (slight overshoot and 1 to 2 oscillations before stabilizing).
If the reference varies from the preset value in steady state, gradually increase the integral gain (rIG), reduce the proportional gain (rPG) in the event of instability (pump applications), find a compromise between response time and static precision (see diagram).
Perform in-production tests throughout the reference range.

The oscillation frequency depends on the system kinematics.

| Parameter | Rise time | Overshoot | Stabilization <br> time | Static error |
| :--- | :---: | :---: | :---: | :---: |
| rPG |  |  | $=$ |  |
| rIG |  |  |  |  |

(1)Parameter can also be accessed in the settings menu (SEt-).
$\square$ These parameters only appear if the function has been enabled.

(1)Parameter can also be accessed in the settings menu (SEt-).

These parameters only appear if the function has been enabled.

## Brake control

The function can only be accessed if LAC = L2 or L3 (page 33).
This function, which can be assigned to relay R2 or to logic output AOC, enables the drive to manage an electromagnetic brake.

## Principle:

Synchronize brake release with the build-up of torque during start-up and brake engage at zero speed on stopping, to prevent jolting.

## Brake sequence

Settings which can be accessed in the FUn- menu:

- Brake release frequency (brL)
- Brake release current (Ibr)
- Brake release time (brt)
- Brake engage frequency (bEn)
- Brake engage time (bEt)
- Brake release pulse (bIP)

Recommended settings for brake control:
1 Brake release frequency:

- Horizontal movement: Set to O.
- Vertical movement: Set to a frequency equal to the nominal slip of the motor in Hz .

2 Brake release current (lbr):

- Horizontal movement: Set to 0.
- Vertical movement: Preset the nominal current of the motor then adjust it in order to prevent jolting on start-up, making sure that the maximum load is held when the brake is released.
3 Brake release time (brt):
Adjust according to the type of brake. It is the time required for the mechanical brake to release.
4 Brake engage frequency (bEn)
- Horizontal movement: Set to O.
- Vertical movement: Set to a frequency equal to the nominal slip of the motor in Hz. Caution: bEn maxi = LSP, you must therefore first set LSP to a sufficient value.
5 Brake engage time (bEt):
Adjust according to the type of brake. It is the time required for the mechanical brake to engage.
6 Brake release pulse:
- Horizontal movement: Set to nO.
- Vertical movement: Set to YES and check that the motor torque direction for "Forward" control corresponds to the upward direction of the load. If necessary, reverse two motor phases. This parameter generates motor torque in an upward direction regardless of the direction of operation commanded in order to maintain the load whilst the brake is releasing.

Motor frequency at min. reference. This parameter can also be modified in the SEt- menu (page 19).

| Brake engage frequency threshold | $\mathrm{nO}-\mathrm{O}$ to LSP | nO |
| :--- | :--- | :--- |

n D: Not adjusted
0 to LSP: Adjustment range (Hz)
If bLC is assigned and bEn remains equal to nO, the drive will lock on a bLF fault at the first run command.

| Brake engage time | 0 to 5 s | 0.5 s |
| :--- | :--- | :--- |
| Brake release pulse |  | nO |

$n \square$ : Whilst the brake is releasing, the motor torque direction corresponds to the direction of rotation commanded.
YE5: Whilst the brake is releasing, the motor torque direction is always forward, regardless of the direction of operation commanded.

Check that the motor torque direction for "Forward" control corresponds to the upward direction of the load. If necessary, reverse two motor phases.
(1)In corresponds to the nominal drive current indicated in the Installation Manual and on the drive rating plate.
$\square$ These parameters only appear if the function has been enabled.

- The motor switching function disables motor thermal protection. An external means of motor thermal protection must therefore be provided.
- If you use this function, do not use the tUn auto-tuning function (page 24) on motor 2 and do not configure tUn = rUn or POn.
- Changes to parameters are only taken into account when the drive is locked.

These parameters only appear if the function has been enabled.

(1)Parameter can also be accessed in the settings menu (SEt-).
$\square$ These parameters only appear if the function has been enabled.

## Management of limit switch

The function can only be accessed if LAC = L2 or L3 (page 33).
It can be used to manage the operation of one or two limit switches (1 or 2 directions of operation):

- Assignment of one or two logic inputs (forward limit switch, reverse limit switch)
- Selection of the type of stop (on ramp, fast or freewheel) Following a stop, the motor is permitted to restart in the opposite direction only.
- The stop is performed when the input is in state 0 . The direction of operation is authorized in state 1.

## Restarting after stop caused by a limit switch

- Send a run command in the other direction (when control is via the terminals, if $\mathrm{tCC}=2 \mathrm{C}$ and $\mathrm{tCt}=$ trn, first remove all the run commands).
or
- Invert the reference sign, remove all the run commands then send a run command in the same direction as before the stop caused by a limit switch.

## Parameters can be accessed with the drive running or stopped.

On the optional remote terminal, this menu can be accessed with the switch in any position.
Some functions have numerous parameters. In order to clarify programming and avoid having to scroll through endless parameters, these functions have been grouped in sub-menus.
Like menus, sub-menus are identified by a dash after their code: LIA- for example.
When the drive is running, the value displayed is that of one of the monitoring parameters. By default, the value displayed is the output frequency applied to the motor (rFr parameter).
Whilst the value of the new monitoring parameter required is being displayed, press and hold down the "ENT" key ( 2 seconds) to confirm the change of monitoring parameter and store this. From now on, the value of this parameter will be displayed while the drive is running (even after it has been disconnected).
If the new choice is not confirmed by pressing the "ENT" key a second time, the drive will return to the previous parameter after it has been switched off.

Note: After disconnection or loss of line supply, the parameter displayed is always the drive status (rdY for example). The selected parameter is displayed after a run command.

|  | Code | Description | Variation range |
| :---: | :---: | :---: | :---: |
|  | LFr | Frequency reference for control via built－in terminal or remote terminal | 0 to 500 Hz |
|  | $r P 1$ | Internal PI reference | 0 to 100\％ |
|  | FrH | Frequency reference before ramp（absolute value） | 0 to 500 Hz |
|  | $r F r$ | Output frequency applied to the motor | -500 Hz to +500 Hz |
|  |  | This parameter is also used for the $+/-$ speed $f$ keypad or display terminal． It displays and checks operation（see page 38） not saved，and it will be necessary to go back i function again． | tion using the $\boldsymbol{\Delta}$ and $\boldsymbol{\nabla}$ keys on the the event of loss of line supply， rFr is SUP－and rFr to enable the $+/-$ speed |
|  | $\begin{gathered} \hline 5 P d l \\ \text { or } \\ 5 P d 己 \\ \text { or } \\ \text { 5Pdヨ } \end{gathered}$ | Output value in customer units SPd1 or SPd2 or SPd3 depending on the SdS parameter，see page $\mathbf{2 2}$（SPd3 in factory settings mode）． |  |
|  | $L E r$ | Current in the motor |  |
|  | ロPr | Motor power |  |
|  |  | 100\％＝Nominal motor power，calculated using the parameters entered in the drC－menu． |  |
|  | ULп | Line voltage（gives the line voltage via the DC bus，motor running or stopped） |  |
|  | EHr | Motor thermal state |  |
|  |  | 100\％＝Nominal thermal state <br> $118 \%$＝＂OLF＂threshold（motor overload） |  |
|  | tHd | Drive thermal state |  |

|  | ロヒr | Motor torque |  |
|  |  | $100 \%$＝Nominal motor torque，calculated using the parameters entered in the drC－ menu． |  |
|  | $r E H$ | Operating time | 0 to 65530 hours |
|  |  | Total time the motor has been powered up： 0 to 9999 （hours），then 10.00 to 65.53 （kilo－hours）． Can be reset to zero by the $r \operatorname{Pr}$ parameter in the FLt－menu（see page 68）． |  |

| Code | Description |
| :---: | :---: |
| CDd | Terminal locking code |
|  | Enables the drive configuration to be protected using an access code. When access is locked using a code, only the monitoring parameters can be accessed, with only a temporary choice of parameter displayed. |

- $\square F F$ : No access locking codes
- To lock access, enter a code (2 to 9999). The display can be incremented using Now press "ENT". "On" appears on the screen to indicate that the access have been locked.
- $\square_{n}$ : A code is locking access (2 to 9999)
- To unlock access, enter the code (incrementing the display using $\Delta$ ) and press "ENT". The code remains on the display and access is unlocked until the next power down. Access will be locked again on the next power-up.
- If an incorrect code is entered, the display changes to "On" and access remain locked. - XXXX: Access is unlocked (the code remains on the screen).
- To reactivate locking with the same code when access have been unlocked, return to "On" using the $\nabla$ button then press "ENT". "On" appears on the screen to indicate that access have been locked.
- To lock access with a new code when access have been unlocked, enter a new code (increment the display using $\boldsymbol{\Delta}$ or ) and press "ENT". "On" appears on the screen to indicate that access have been locked.
- To clear locking when access have been unlocked, return to "OFF" using the button and press "ENT". "OFF" remains on the screen. Access is unlocked and will remain unlocked until the next restart.

| tU5 |  | State of auto-tuning |
| :---: | :---: | :---: |
|  |  | ヒ 月 : The default stator resistance value is used to control the motor. <br> $P E \cap d$ : Auto-tuning has been requested but not yet performed. <br> Pr पL: Auto-tuning in progress. <br> F $A$ IL: Auto-tuning has failed. <br> $d \square \cap E$ : The stator resistance measured by the auto-tuning function is used to manage the drive. <br> $5 \operatorname{trd}$ : The cold stator resistance (rSC other than nO ) that is used to control the motor. |
| $U d P$ |  | Indicates the ATV3 1 firmware version. E.g.: 1102 = V1.1 IEO2. |
| LIA- |  | Logic input functions |
|  | $\begin{array}{ll} L & I I A \\ L & I Z A \\ L & I \exists A \\ L & I 4 A \\ L & I 5 A \\ L & I G A \end{array}$ | Can be used to display the functions assigned to each input. If no functions have been assigned, nO is displayed. Use the $\boldsymbol{A}$ and $\boldsymbol{\nabla}$ arrows to scroll through the functions. If a number of functions have been assigned to the same input, check that they are compatible. |
|  | L 15 | Can be used to display the state of the logic inputs (using the segments of the display: high = 1, low = 0) <br> State 1 <br> State 0 <br> Example above: LI1 and LI6 are at 1, LI2 to LI5 are at 0. |
| AIA- |  | Analog input functions |
|  | $\begin{array}{lll} A & I & I A \\ A & I & A \\ A & I \exists \end{array}$ | Can be used to display the functions assigned to each input. If no functions have been assigned, nO is displayed. Use the and $\boldsymbol{\nabla}$ arrows to scroll through the functions. If a number of functions have been assigned to the same input, check that they are compatible. |

## Servicing

The ATV 31 does not require any preventative maintenance. It is nevertheless advisable to perform the following regularly:

- Check the condition and tightness of connections.
- Ensure that the temperature around the unit remains at an acceptable level and that ventilation is effective (average service life of fans: 3 to 5 years depending on the operating conditions).
- Remove any dust from the drive.

## Assistance with maintenance, fault display

If a problem arises during setup or operation, ensure that the recommendations relating to the environment, mounting and connections have been observed.

The first fault detected is stored and displayed, flashing, on the screen: the drive locks and the fault relay (RA - RC) contact opens, if it has been configured for this function.

## Clearing the fault

Cut the power supply to the drive in the event of a non-resettable fault.
Wait for the display to go off completely.
Find the cause of the fault in order to correct it.
The drive is unlocked after a fault by:

- Switching off the drive until the display disappears completely, then switching on again
- Automatically in the cases described in the "automatic restart" function (FLt- menu, Atr = YES)
- Via a logic input when this input is assigned to the "fault reset" function (FLt-menu, rSF = Lle)

## Monitoring menu:

This is used to prevent and find the causes of faults by displaying the drive status and its current values.
Spares and repairs:
Consult Schneider Electric product support.

## Drive does not start, no fault displayed

- If the display does not light up, check the power supply to the drive and check the wiring of inputs AI1 and AI2 and the connection to the
- RJ45 connector.
- The assignment of the "Fast stop" or "Freewheel stop" functions will prevent the drive from starting if the corresponding logic inputs are not powered up. The ATV3 1 then displays " nSt " in freewheel stop mode and "FSt" in fast stop mode. This is normal since these functions are active at zero so that the drive will be stopped safely if there is a wire break.
- Check that the run command input(s) have been actuated in accordance with the chosen control mode (tCC parameter in the I-Omenu).
- If an input is assigned to the limit switch function and this input is at zero, the drive can only be started up by sending a command for the opposite direction (see page 64).
- If the reference channel (page $\mathbf{3 3}$ ) or the control channel (page 34 ) is assigned to Modbus or CANopen, the drive displays nSt on power-up and remains at stop until the communication bus sends a command.
- If the LED on the DC bus is lit and nothing appears on the display, check that there is no short-circuit on the 10 V power supply.
- If the drive displays "rdY" and refuses to start, check that there is no short-circuit on the 10 V power supply and check the wiring of inputs AI1 and AI2 and the connection to the RJ45 connector.

## Faults which cannot be reset automatically

The cause of the fault must be removed before resetting by switching off and then on again. $\mathrm{CrF}, \mathrm{SOF}, \mathrm{tnF}, \mathrm{bLF}$ and OPF faults can also be reset remotely via logic input (rSF parameter in the FLt-menu page 66).

| Fault | Probable cause | Remedy |
| :---: | :---: | :---: |
| bLF <br> Brake sequence | - Brake release current not reached <br> - Brake engage frequency $b E n=$ nO (not adjusted) when brake logic bLC is assigned. | - Check the drive/motor connection. <br> - Check the motor windings. <br> - Check the lbr setting in the FUn- menu (see page 60). <br> - Carry out the recommended adjustment of bEn (see pages 59 and 60). |
| $\begin{aligned} & L r F \\ & \text { Capacitor load circuit } \end{aligned}$ | - Load relay control fault or charging resistor damaged | - Replace the drive. |
| $\begin{aligned} & \text { EEF } \\ & \text { EEPROM fault } \end{aligned}$ | - Internal memory fault | - Check the environment (electromagnetic compatibility). <br> - Replace the drive. |
| InF Internal fault | - Short-circuit on the 10 V power supply <br> - Internal fault | - Check the circuits connected to the 10 V . <br> - Check the wiring of inputs AI1 and AI2 and the connection to the RJ45 connector. <br> - Check the environment (electromagnetic compatibility). <br> - Replace the drive. |
| $\begin{aligned} & \text { DLF } \\ & \text { Overcurrent } \end{aligned}$ | - Incorrect parameters in the SEtand drC- menus <br> - Inertia or load too high <br> - Mechanical blockage | - Check the SEt- and drC- parameters. <br> - Check the size of the motor/drive/load. <br> - Check the state of the mechanism. |
| $\begin{aligned} & 5[F \\ & \text { Motor short-circuit } \end{aligned}$ | - Short-circuit or earthing at the drive output <br> - Significant earth leakage current at the drive output when several motors are connected in parallel | - Check the cables connecting the drive to the motor, and the motor insulation. <br> - Reduce the switching frequency. <br> - Connect chokes in series with the motor. |
| $\begin{aligned} & \hline 5 \square F \\ & \text { Overspeed } \end{aligned}$ | - Instability or <br> - Driving load too high | - Check the motor, gain and stability parameters. <br> - Add a braking resistor. <br> - Check the size of the motor/drive/load. |
| $\begin{aligned} & E \cap F \\ & \text { Auto-tuning fault } \end{aligned}$ | - Special motor or motor whose power is not suitable for the drive <br> - Motor not connected to the drive | - Use the L or the P ratio (see Uft page 24). <br> - Check the presence of the motor during auto-tuning. <br> - If a downstream contactor is being used, close it during auto-tuning. |

## Faults which can be reset with the automatic restart function, after the cause has disappeared

These faults can also be reset by switching the drive off and on again or via a logic input (rSF parameter in the FLt- menu page 66)

| Fault | Probable cause | Remedy |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { L } \square F \\ & \text { CAnopen fault } \end{aligned}$ | - Interruption in communication on the CANopen bus | - Check the communication bus. <br> - Please refer to the product-specific documentation. |
| $E P F$ <br> External fault | - According to user | - According to user |
| $\begin{aligned} & \text { LF F } \\ & \text { Loss of 4-20mA } \end{aligned}$ | - Loss of the 4-20 mA reference on input AI3 | - Check the connection on input AI3. |
| DbF Overvoltage during deceleration | - Braking too sudden or driving load | - Increase the deceleration time. <br> - Install a braking resistor if necessary. <br> - Activate the brA function (page 44) if it is compatible with the application. |
| $\square H F$ <br> Drive overheated | - Drive temperature too high | - Check the motor load, the drive ventilation and the environment. Wait for the drive to cool down before restarting. |
| पL F Motor overload | - Triggered by excessive motor current <br> - Incorrect value of parameter rSC | - Check the ItH setting (motor thermal protection) (page 20), check the motor load. Wait for the drive to cool down before restarting. <br> - Measure rSC again (page 24). |
| DPF <br> Motor phase loss | - Loss of one phase at drive output <br> - Downstream contactor open <br> - Motor not connected or motor power too low <br> - Instantaneous instability in the motor current | - Check the connections from the drive to the motor. <br> - If a downstream contactor is being used, set OPL to OAC (FLt- menu page 67). <br> - Test on a low power motor or without a motor: In factory settings mode, motor phase loss detection is active (OPL = YES). To check the drive in a test or maintenance environment without having to switch to a motor with the same rating as the drive (particularly useful in the case of high power drives), deactivate motor phase loss detection (OPL = no). <br> - Check and optimize the UFr (page 20), UnS and nCr (page 23) parameters and perform auto-tuning with tUn (page 24). |
| $\square 5 F$ <br> Overvoltage | - Line voltage too high <br> - Disturbed line supply | - Check the line voltage. |
| PHF <br> Line phase failure | - Drive incorrectly supplied or a fuse blown <br> - Failure of one phase <br> - 3-phase ATV31 used on a single phase line supply <br> - Unbalanced load <br> This protection only operates with the drive on load. | - Check the power connection and the fuses. <br> - Reset. <br> - Use a 3-phase line supply. <br> - Disable the fault by setting IPL = nO (FLt- menu page 67). |
| $5 L F$ <br> Modbus fault | - Interruption in communication on the Modbus bus <br> - Remote terminal enabled (LCC = YES page 40) and terminal disconnected. | - Check the communication bus. <br> - Please refer to the product-specific documentation. <br> - Check the link with the remote terminal. |

## Faults which can be reset as soon as their cause disappears

| Fault | Probable cause | Remedy |
| :---: | :---: | :---: |
| LFF <br> Configuration fault | - The current configuration is inconsistent. | - Return to factory settings or call up the backup configuration, if it is valid. See the FCS parameter in the $\mathrm{I}-\mathrm{O}-$, drC-, CtL- or FUn- menu. |
| [FI Configuration fault via serial link | - Invalid configuration The configuration loaded in the drive via the serial link is inconsistent. | - Check the configuration loaded previously. <br> - Load a consistent configuration. |
| USF Undervoltage | - Line supply too low <br> - Transient voltage dip <br> - Damaged load resistor | - Check the voltage and the voltage parameter. USF trip threshold <br> ATV31e000M2: 160V <br> ATV3100eथM3X: 160V <br> ATV31e0e日N4: 300V <br> ATV31eeeeS6X: 430V <br> - Replace the drive. |
