Meta solution

**MCCB = ELCB**

## Upgrade of Meta-MEC series

# ... *Metasol* Low voltage circuit breaker

- $I_{cs} = 100\% \times I_{cu}$
- $U_i = 750V$
- $U_{imp} = 8kV$

- *Compatible and differentiated design*

- Compatible with the Meta-MEC
- Outlook differentiated design

- *Same External dimension with MCCB and ELCB*

- *Upgrade the coordination*

- Upgrade the coordination with Susol / Meta-MEC mass capacity

- *Upgrade breaking capacity*

- N100AF : 10 → 18kA
- S125AF : 25 → 37kA
- S250AF : 25 → 37kA
- H250AF : 35 → 50kA
- N400AF : 25 → 37kA
- S400AF : 35 → 50kA
- S800AF : 50 → 65kA

- *$I_{cs} = 100\% I_{cu}$*

# *Metasol* MCCB/ELCB System overview

## ■ Various installable Accessories

- Wider range of installable accessories compared to Meta MEC series.
- Composed of User Friendly Method.

# System overview

# *Metasol* MCCB/ELCB Internal accessories

## ■ Internal Accessories

Internal Accessories can be commonly used in all Metasol MCCB and ELCB  
(Notice: Exception of SHT, UVT in ELCB)

## Internal accessories

### Common use to all Metasol MCCBs and ELCBs

#### Alarm Switch (AL)

Alarm switches offer provisions for immediate audio or visual indication of a tripped breaker due to overload, short-circuit, operation of shunt trip, or undervoltage trip conditions, operation of push button.

They are particularly useful in automated plants where operators must be signaled about changes in the electrical distribution system. This switch features a closed contact when the circuit breaker is tripped automatically. In other words, this switch does not function when the breaker is operated manually. Its contact is open when the circuit breaker is reset.

#### Auxiliary Switch (AX)

Auxiliary switch is for applications requiring remote "ON" and "OFF" indication. Each switch contains two contacts having a common connection. One is open and the other closed when the circuit breaker is open, and vice-versa.

#### Undervoltage trip (UVT)

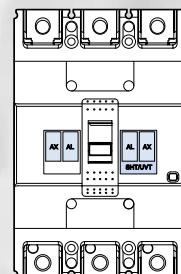

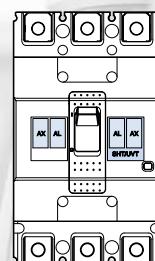

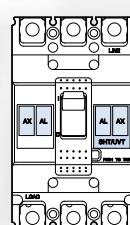

The undervoltage trip automatically opens a circuit breaker when voltage drops to a value ranging between 35% to 70% of the line voltage. The operation is instantaneous, and the circuit breaker cannot be reclosed until the voltage returns to 85% of line voltage.

Continuously energized, the undervoltage trip must be operating before the circuit breaker can be closed.

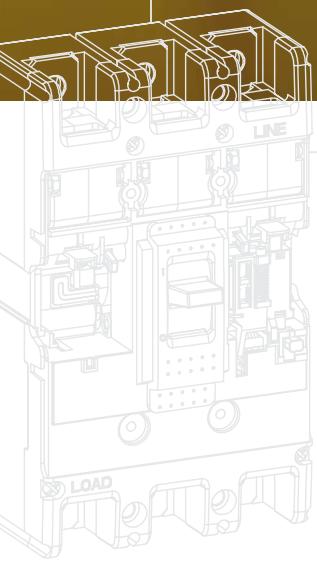

#### Shunt Trip (SHT)

The shunt trip opens the mechanism in response to an externally applied voltage signal. LS shunt trips include coil clearing contacts that automatically clear the signal circuit when the mechanism has tripped. contact with live parts and thereby guarantee protection against direct contacts.

# *Metasol* MCCB/ELCB External accessories

## ■ External Accessories

Designed for various mount and user safety.

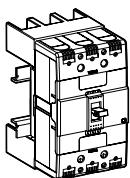

# External accessories

## Front and rear connection

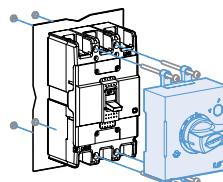

Several kinds of terminals can be equipped with ELCBs as well as MCCBs.

- Terminals for front connection
- Rear connection terminals

## Plug-in base

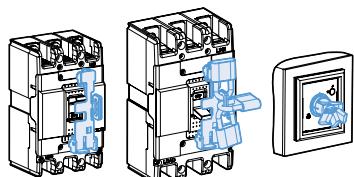

It makes to extract and/or rapidly replace the circuit breaker without having to touch connections.(Easy replacement and maintenance)

## Direct & Extended Rotary Handle

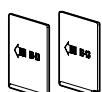

There are two types of rotary handles.

- Direct rotary handle(with or w/o key lock device)
- Extended rotary handle

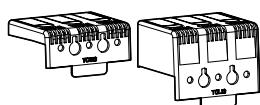

## Locking device

- Fixed padlock
- Removable padlock
- Key lock device on direct handle

## Insulation barrier

These allow the insulation characteristics between the phases at the connections to be increased.

## Insulation terminal cover

The terminal covers are applied to the circuit-breaker to prevent accidental contact with live parts and thereby guarantee protection against direct contacts.

# Marking and configuration

## MCCB

**MCCB model**

- ABN: Economic type
- ABS: Standard type
- ABH: High capacity type

### Standardized characteristics

Ui: Rated insulation voltage

Uimp: Impulse withstand voltage

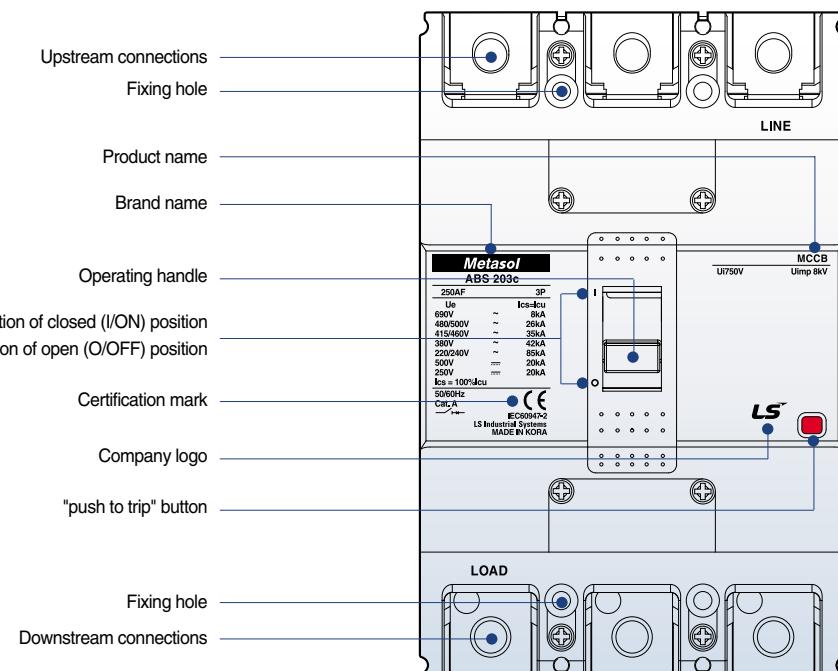

Ue: Rated operational voltage

Icu: Ultimate breaking capacity

Ics: Service breaking capacity

## MCCB

## ELCB

Rated frequency

Standard

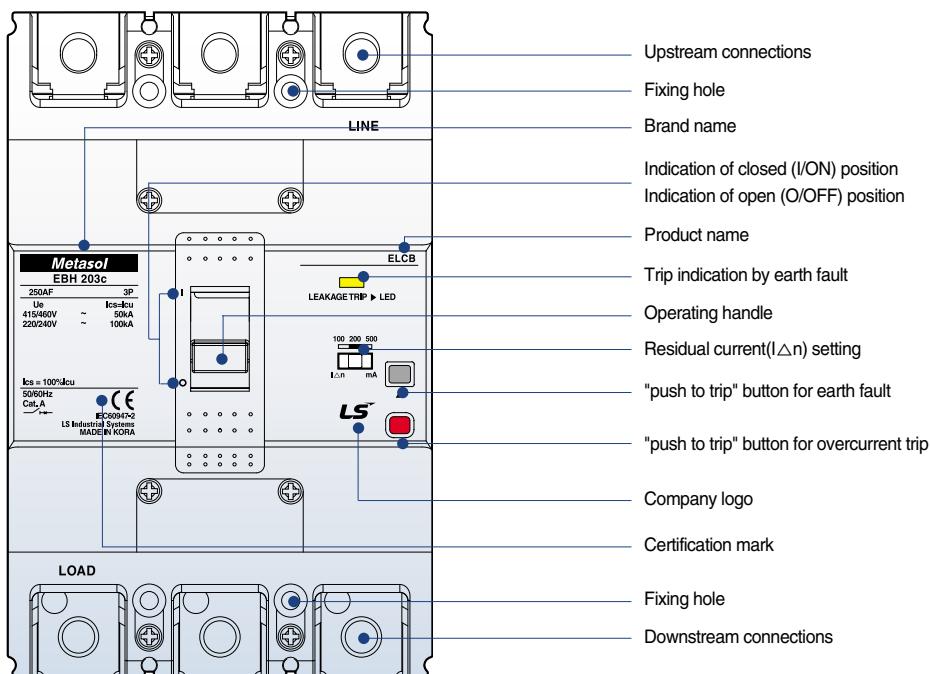

Manufacturer

Utilization category

### ELCB model

- EBN: Economic type
- EBS: Standard type
- EBH: High capacity type

## ELCB

# External configuration

## MCCB

### ① Handle

- Function of indications
- "ON" "OFF" "TRIP"
- Resetting  
When the handle indicates "tripped" position it must first be reset by moving the handle to the "OFF" position and then closing is possible
- Trip-Free even if the handle is held at "ON", the breaker will trip if an over current flows
- Suitable for Verification of the main contact position under abnormal conditions because the handle doesn't indicate open position

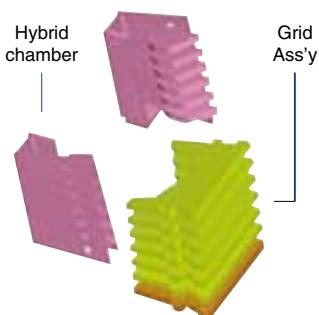

### ② Arc-Extinguishing unit

LS patent technique PASQ

Arc-Extinguishing unit

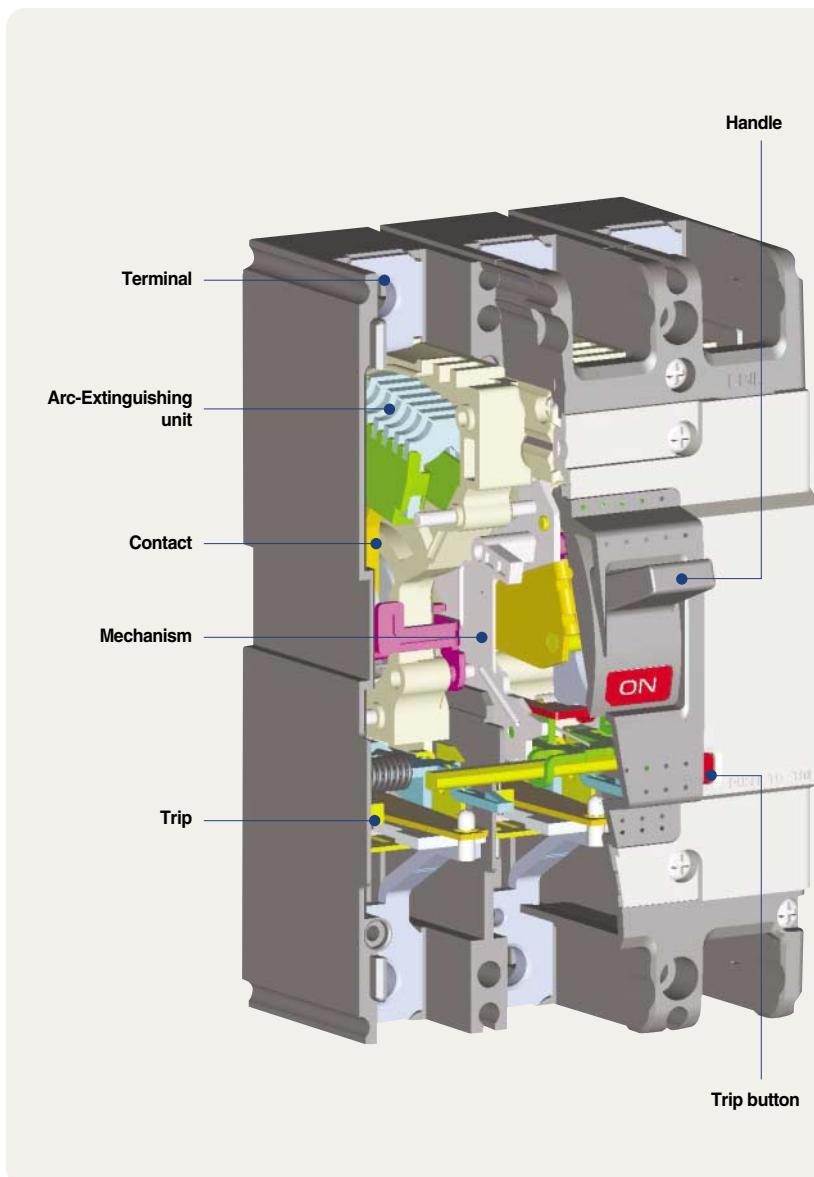

PASQ : Puffer Assisted Self-Quenching

- Reduction of arc voltage for a short time

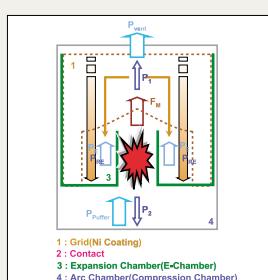

### ③ Trip button (push to trip)

- Enables tripping mechanically from outside, for confirming the operation of the accessory switches and the manual resetting function.

## A Application of PASQ Arc Extinguishing

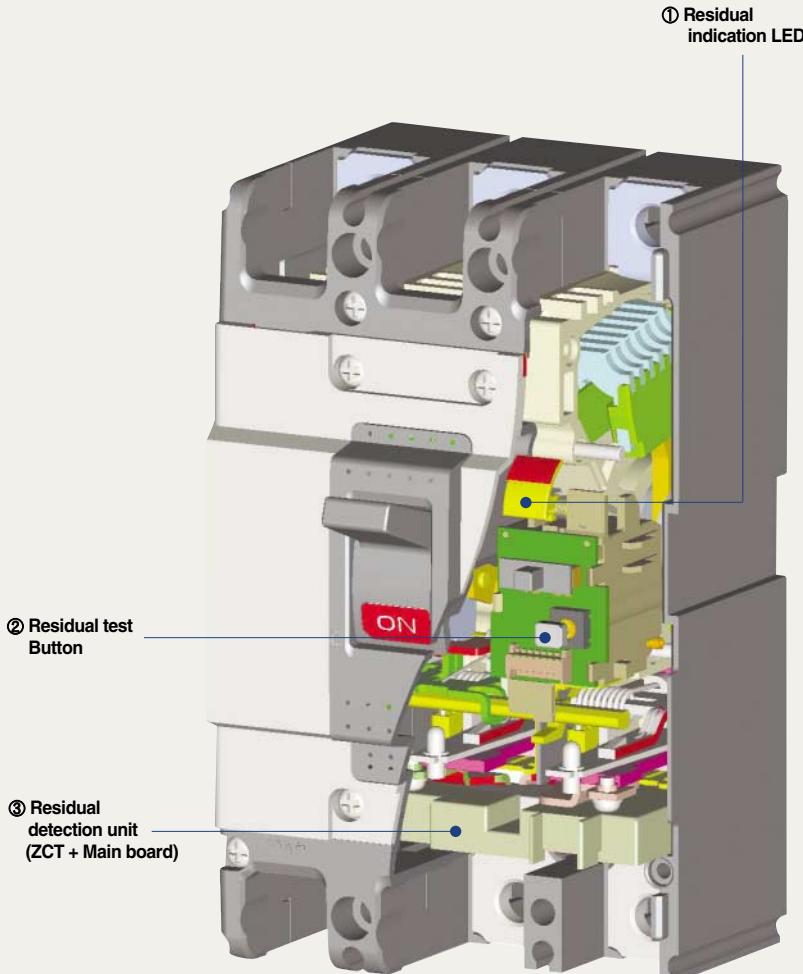

- The reduction of breaking time by applying PASQ arc extinguishing for inhibition of arc voltage for a short time.

## A Application of Current limiting structure

- Current limiting repulsion structure (U fixed structure)
- Toggle structure
  - When the operating unit repulses by short circuit current, repulsion structure at bigger angle.

## ELCB

### ① Residual indication LED

- Normal situation is yellow , trio situation is red

### ② Residual test Button

- Special design for Upgrade to prohibit resistance accident

### ③ Residual detection unit

(ZCT + Main board)

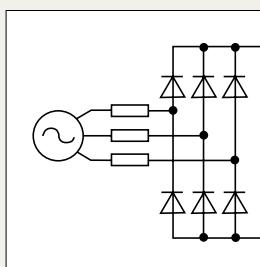

- For upgrade the design is selected the 3 phase input power method and in case of Voltage problem, it can break residual current safely.

### Upgrade coil operation by special design

- Sliding structure application of Trip lever
- Trip special design by applying design Button method.
- Upgrade the testing unit

### 3 phase power supply method

- In case of 1 phase loss residual operation upgrade
- New IEC standard

### Terminal block type

## Auxiliary and Alarm switch

### Auxiliary switch (AX)

Auxiliary switch is for applications requiring remote “ON” and “OFF” indication.

Each switch contains two contacts having a common connection.

One is open and the other closed when the circuit breaker is open, and viceversa.

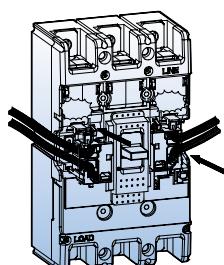

### Alarm switch (AL)

Alarm switches offer provisions for immediate audio or visual indication of a tripped breaker due to overload, short circuit, shunt trip, or undervoltage release conditions.

They are particularly useful in automated plants where operators must be signaled about changes in the electrical distribution system. This switch features a closed contact when the circuit breaker is tripped automatically. In other words, this switch does not function when the breaker is operated manually.

Its contact is open when the circuit breaker is reset.

### Combination switch (AX+AL)

It consists of one auxiliary switch (AX) and one alarm switch (AL) in a body to connect into the same position of the breaker.

### Contact (AX+AL)

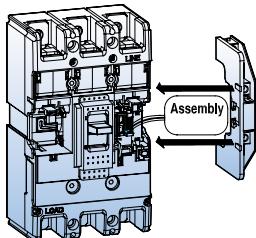

MCCB	ON	OFF	TRIP
AX	AXc1 → AXa1 AXc1 → AXb1	AXc1 → AXa1 AXc1 → AXb1	
AL	AXc1 → AXa1 AXc1 → AXb1		AXc1 → AXa1 AXc1 → AXb1

### Rating (AX+AL)

Conventional thermal current, $I_{th}$	5A		
Rated operational current, $I_e$	Voltage, $U_e$	Current, $I_e$	
		Resistive load	Inductive load

	250V	3	2
	500V	-	-
DC	30V	4	3
	125V	0.4	0.4
	250V	0.2	0.2

# Accessories

## Shunt trip, SHT

The shunt trip opens the mechanism in response to an externally applied voltage signal. The releases include coil clearing contacts that automatically clear the signal circuit when the breaker has tripped. This is not available for ELCBs of 30~250AF.

### Rating for 30~250AF

Control voltage, Ue	Power consumption		
	AC (VA)	DC (W)	mA
Voltage	AC/DC 12V	0.35	0.36
	AC/DC 24V	0.64	0.65
	AC/DC 48V	1.09	1.1
	AC/DC 60V	1.2	1.22
	AC/DC 100~130V	0.73	0.75
	AC/DC 200~250V	1.21	1.35
	AC 380~450V	1.67	-
	AC 440~500V	1.68	-
	Max.opening time	50ms (max.)	
Tightening torque of terminal screw		12 kgf · cm	

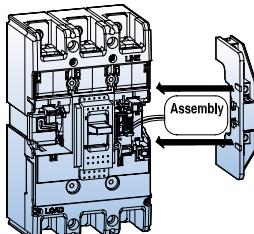

Note:

- Range of operational voltage: 0.7 ~ 1.1Vn
- Frequency (Only AC): 45Hz ~ 65Hz

### Rating for 400~800AF

Control voltage, Ue	Power consumption		
	V	mA	W
AC/DC 24~48	AC 24	14	0.3
AC 100~125/DC 100~110	DC 24	15.4	0.4
AC 200~240/DC 200~220	AC 48	14	0.7
AC 380~460	DC 48	16	0.8
AC 480~550	AC 110	6	0.7
Note: Range of operational voltage		AC: 0.85 ~ 1.1Vn	
DC: 0.75 ~ 1.25Vn			
	DC 110	6.6	0.7
	AC 220	6.8	1.5
	DC 200	7.6	1.5
	AC 440	4.3	1.9
	AC 480	4.4	3.3
	AC 550	4.6	2.4

## Undervoltage release, UVT

The undervoltage release automatically opens a circuit breaker when voltage drops to a value ranging between 20% to 70% of the line voltage. The operation is instantaneous, and after tripping, the circuit breaker cannot be re-closed again until the voltage returns to 85% of line voltage.

Continuously energized, the undervoltage release must be operating before the circuit breaker can be closed. This is not available for ELCBs of 30~250AF.

- Range of tripping voltage: 0.2 ~ 0.7Vn
- Reset and closing of a breaker is possible when the control voltage is over 0.85Vn
- Frequency (Only AC): 45Hz ~ 65Hz

### Rating for 30~250AF

Control voltage, Ue	Power consumption		
	AC (VA)	DC (W)	mA
Voltage	AC/DC 24V	0.64	27
	AC/DC 48V	1.09	23

## Terminal covers

TCS (Short type)

TCL (Long type)

The terminal covers are applied to the circuit-breaker to prevent accidental contact with live parts and thereby guarantee protection against direct contacts.

Two types by length are available and provide IP40 degree of protection.

- **Short type covers, TCS:**

For fixed circuit-breakers with rear terminals and for moving parts of plug-in.

- **Long type covers, TCL:**

For fixed circuit-breakers with front, front extended, front for cables terminals.

Note: Terminal covers for 400AF and 800AF MCCBs are in acrylic.

Short type construction

Long type construction

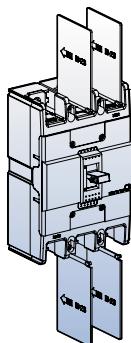

## Insulation barriers

Insulation barrier allows the insulation characteristics between the phases at the connections to be increased. They are mounted from the front, even with the circuit-breaker already installed, inserting them into the corresponding slots.

They are incompatible with both the insulating terminal covers.

It is possible to mount the phase separating partitions between two circuit-breakers side by side.

<b>IBL800</b>	ABN/S/L800c	EBN/S/L800c

Insulation barriers for line side are provided as standard.

# Accessories

## Rear connection terminals

Rear connection terminals are used to adapt the circuit breakers to switchboards or other applications that require rear connection.

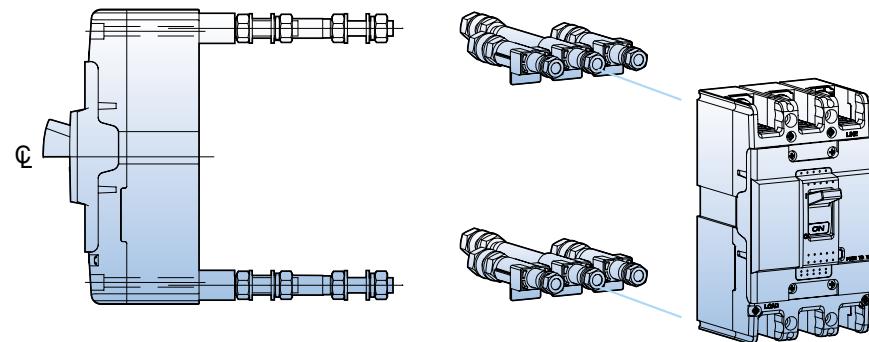

There are two kinds of rear connection terminals.

- Flat type
- Round type

### Round type terminals

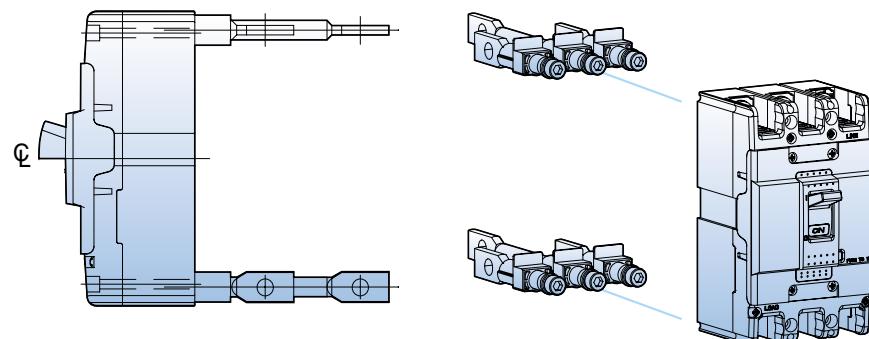

Breaker	For 2-pole	For 3-pole	For 4-pole
ABN100c 50AF	RTR1-52	RTR1-53	-
ABN100c 100AF	RTR1-102	RTR1-103	RTR1-104

AB□400c	X-402	X-403	X-404
AB□800c	X-802	X-803	X-804

## Plug-in devices

Plug-in base

Plug-in device makes it possible to extract and/or rapidly replace the circuit breaker without having to touch connections for ship and important installations.

The plug-in base is the fixed part of the plug-in version of the circuit-breaker.

It will be installed directly on the back plate of panel.

The circuit-breaker is racked out by unscrewing the top and bottom fixing screws.

### Normal type Plug-in MCCB

- MCCB current rating upto 250A
- generally used in switchgears

### Double-row type Plug-in MCCB

- For 125AF MCCB
- generally used in branch circuits

## Safety clearance

When installing a circuit breaker, safety clearances must be kept between the breaker and panels, bars and other protection devices installed nearby. These safety clearances are depend on the ultimate breaking capacity and are defined by tests carried out in accordance with standard IEC 60947-2.

When a short circuit interruption occur, high temperatures pressures are present in and above the arc chambers of the circuit-breaker. In order to allow the pressure to be distributed and to prevent fire and arcing or short-circuit currents, safety clearances are required.

# Technical Information

## Standards & Approval

**Metasol series circuit breakers and auxiliaries comply with the following international standard:**

- IEC 60947-1  
Low-voltage switchgear and controlgear - Part 1: General rules
- IEC 60947-2  
Low-voltage switchgear and controlgear - Part 2: Circuit-breakers

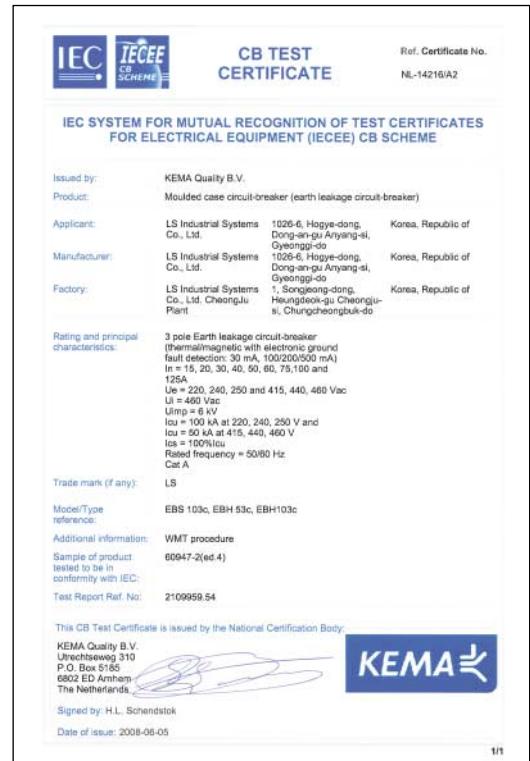

**The following certificates are available on a request.**

- CE Declaration of conformity
- Certificate of conformance test (CB) - IEC 60947
- Full type test report issued by KEMA

### CE conformity marking

The CE conformity marking shall indicate conformity to all the obligations imposed on the manufacturer, as regards his products, by virtue of the European Community directives providing for the affixing of the CE marking.

When the CE marking is affixed on a product, it represents a declaration of the manufacturer or of his authorized representative that the product in question conforms to all the applicable provisions including the conformity assessment procedures.

## Standard Use Environment

### Standard Use Environment for Molded Case Circuit Breaker

The operation characteristic of Molded Case Circuit Breaker including short-circuit, overload, endurance and insulation is often influenced largely by external environment and thus should be applied appropriately with conditions of the place where it is used taken into consideration. In particular, the operation characteristic of the circuit breaker with a thermal magnetic trip element (FTU, FMU, ATU) applied changes a bit with the ambient temperature so you have to adjust the value of power rating accordingly when it is actually in use.

- 1) Ambient Temperature: Within the range of -5°C ~+40°C (However, the average for the duration of 24 hours must not exceed 35°C.)
- 2) Relative Humidity: Within the range of 45~85%
- 3) Altitude: 2,000m or less (However, if it exceeds 1,000m, atmosphere correction through humidity test and withstand voltage test can be considered.)
- 4) Atmosphere where excessive steam, oil steam, smoke, dust, salt and other corrosive materials do not exist

- If a standard circuit breaker is used in high temperature exceeding 40°C , you are advised to use it according to the current corrected for each level of ambient temperature in catalog.
- If used in conditions of highly humidity, the dielectric strength or electric performance may be degraded.

- There is no problem in conduction switch, trip or short circuit isolation in the temperature of -20°C.
- Passing or storage in stone-cold area is allowed in the temperature of 40°C.
- The operating characteristic of the breaker with a thermal magnetic trip element changes as the base ambient temperature is adjusted to 40°C.

- It is highly recommended to use a dust cover or anti-humid agent if it is used in dusty and humid conditions.
- Excessive vibration may cause a trip break such as connection fault or flaw on mechanical parts.

- If it is left ON or OFF for a long time, it is recommended to switch load current on a regular basis.
- It is recommend to put it in the sealed protection if corrosive gas is prevalent.

# Technical Document

## Special Use Environment

### Environment where Ambient Temperature Exceeds 40°C

The temperate of each module of a Molded Case Circuit Breaker is the sum of temperature increase by conduction and ambient temperature and if the ambient temperature exceeds 40°C the passing current needs to be reduced so that the temperature of such element as internal insulator of MCCB exceed the maximum allowable temperature.

The base ambient temperature of Metasol breaker is set as 40°C so if it has to be used in conditions with higher temperature than this, the rated current is required to be reduced a little as described in the table below.

**Table of Rated Current for Metasol MCCB Corrected according to Ambient Temperature**

Ampere Frame	Rated current	Model Name of Breaker	Rated current	Table of Rated Current Corrected according to Ambient Temperature (A)						
				10°C	20°C	30°C	40°C	45°C	50°C	55°C

# Technical Document

## Special Use Environment

### Environment where Ambient Temperature is -5°C or less

Molded Case Circuit Breaker is subject to the effect of low temperature brittle of metal part inside and insulator, or changes in viscosity of lubricating oil in device, extra care should be taken not to have the temperature drop extremely with the use of such device as space heater. In addition, in case of using a thermal magnetic trip element (FTU, FMU, ATU), the operating characteristic changes toward the difficult direction, so you should identify the relationship of protection and correct accordingly.

Although MCCB is not affected by conduction switch, trip, or short circuit isolation in the temperature of -20°C, it is highly recommended to use a temperature maintaining device such as space heater. In addition, transportation and passing in stone-cold area in the temperature as low as -40°C is allowed but it is recommended to leave the status of MCCB off or tripped in order to minimize the effect of brittle due to a low temperature.

### High Humidity Condition (Relative Humidity 85% or more)

Using Molded Case Circuit Breaker in a place of high humidity requires a rigorous maintenance including installation of anti-humidity agent within the structure in order to prevent the insulation sag of insulator or corrosion of mechanical parts as a result of high humidity. Also, in case of installing MCCB within the enclosed equipment, a space heater needs to be installed as well to prevent dew condensation that might occur due to a drastic temperature change.

### Environment where Petrochemical Gas Exists

The contact material of Molded Case Circuit Breaker is silver or silver alloy which develops creation of petrochemical coat that might cause a poor connection if it gets in contact with petrochemical gas.

However, it is easy for petrochemical coat to be mechanically taken off so it is no problem if make-and break operation occurs frequently but it needs to be switched back and forth between make and break if the operation rarely occurs.

The lead wire of moving contact of Molded Case Circuit Breaker can be disconnected as it is corroded or hardened by petrochemical gas. The silver coating is effective to prevent this from occurring and there is a need to increase durability of MCCB with the use of silver coated lead wire if it is used in environment with thick petrochemical gas.

### Environment where Potentially Explosive Gas Exists

It is advised, in principle, not to install a Molded Case Circuit Breaker that switches and inhibits current in a dangerous place such as this one.

### Impact of Altitude

If an MCCB is used in an elevated area higher than 2000m sea level, its operating performance is subject to dramatic drop in atmospheric pressure and temperature. For example, the air pressure is reduced to 80% of ordinary pressure at 2,200m and further 50% at 5,500m although the short-circuit performance is not affected. If it is used in areas of high sea level, you can do correction based on the correction parameter table in high altitude environment, as described below.

[Correction Parameter Table for Altitude]

\* Refer to the correction parameter table in high altitude environment (ANSI C37.29-1970)

#### 1) How to Correct Voltage:

- If the rated voltage is AC 600V at 4,000m above sea level,  
600V (rated voltage) × 0.82 (correction parameter) = 492V.

#### 2) How to Correct Current:

- If the rated voltage is AC 800A at above 4,000m sea level,  
800A (rated current) × 0.96 (correction parameter) = 768A.

Altitude	Voltage Correction Parameter	Current Correction Parameter
2,000m	1.00	1.00
3,000m	0.91	0.98
4,000m	0.82	0.96
5,000m	0.73	0.94
6,000m	0.65	0.92

## Environment with Vibration and Impulse Exercised

### Impact of Vibration and Impulse

An excessive vibration and impulse may cause damage on breaker or other security problems including dynamic strength. An appropriate consideration is required to select a right MCCB for an adverse environmental stress such as this one. Moreover, this stress may incur from vibration during transportation, magnetic impulse while manipulating a switch or may be affected by equipment in surrounding area.

There is a standard call [Vibration Testing Method for Small Electric Appliances] for vibration and impulse test for electric equipment and the seismic and endurance tests of Molded Case Circuit Breaker are conducted in accordance with this standard, considering the circumstance mentioned above.

### Vibration

The magnitude of vibration is measured by double amplitude and frequency with the following equation with accelerator.

$$\alpha g = 0.002 \times \text{frequency(Hz)} \times \text{double amplitude (mm)}$$

\*  $\alpha g$ : multiple of gravitational acceleration ( $g=9.8\text{m/sec}^2$ )

There are three types of vibration tests including resonance test, vibration endurance test, and malfunction test as described below.

#### 1) Resonant Test

Alter the frequency of sinusoidal wave within the range of 0~55Hz gradually with 0.5~1mm of double amplitude applied to see if there is any occurrence of vibration on a specific part of MCCB.

#### 2) Vibration Endurance Test

A sinusoidal wave with double amplitude of 0.5~1mm and frequency of 55Hz(resonant frequency obtained in previous clause if there is a resonant point) is manually created to check the operational status.

#### 3) Malfunction Test

Apply vibration for 10 minutes for each condition of altering double amplitude and frequency to check if there is any malfunction in MCCB.

### Impulse

The magnitude of impulse is denoted by the multiple of gravitational acceleration imposed on the equipment and part. The test is conducted through a drop impulse test.

### Impact of High Frequency

In case of high frequency current, you are required to reduce the rated current of the breaker with a thermal magnetic trip element embedded due to heat incurred by the skin effect of conductor and/or core loss of structure. The reduction rate varies according to the Frame Size and rated current and decreases down to 70~80% at 400Hz. In addition, the core loss decreases attractive force, which leads to increase of instantaneous trip current.

\* Core loss: It refers to the electrical loss in a transformer caused by magnetization of the core that changes over time and is categorized into hysteresis loss and eddy current loss.

\* Hysteresis loss: It takes up the majority portion of no-load loss of electric equipment and is calculated like this.

$$Ph = \sigma f B_{mn}$$

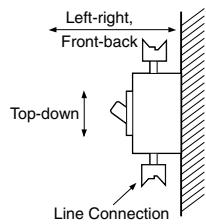

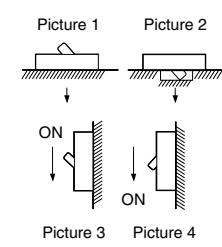

Bm: maximum value of magnetic flux density, n: constant(1.6~2.0), f: frequency,  $\sigma$ : hysteresis constant

\* Eddy current: It refers to an induced electric current formed within the body of a conductor when it moves through a non-uniform or changing magnetic field. The eddy current that incurs at winding of transformer or core is considered as one of the transformer losses as a part of exciting current. It is also called 'eddy current loss' .

## Green Innovators of Innovation

### Safety Instructions

- For your safety, please read user's manual thoroughly before operating.
- Contact the nearest authorized service facility for examination, repair, or adjustment.
- Please contact a qualified service technician when you need maintenance.  
Do not disassemble or repair by yourself!
- Any maintenance and inspection shall be performed by the personnel having expertise concerned.
